Time taken	9 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What role does the discount factor (γ) play in TD learning?

- a. It discounts future rewards to account for their uncertainty
- b. It determines the speed of convergence
- c. It controls the exploration-exploitation trade-off
- d. It adjusts the learning rate during training

Your answer is incorrect.

The correct answer is: It discounts future rewards to account for their uncertainty

Question **2**

Not answered

Marked out of 1.00

In TD learning, what does the term "bootstrapping" refer to?

- a. Restarting the learning process when convergence is not reached
- b. Using the estimated value of a state to update the value of another state
- c. Employing advanced exploration strategies
- d. Using reinforcement learning with deep neural networks

Your answer is incorrect.

The correct answer is: Using the estimated value of a state to update the value of another state

Question **3**

Not answered

Marked out of 1.00

Which of the following is a potential drawback of TD learning in some environments?

- a. TD learning can lead to biased value function estimates.
- b. TD learning is only effective in fully observable environments.
- c. TD learning doesn't utilize any exploration strategies.
- d. TD learning is computationally expensive and slow.

Your answer is incorrect.

The correct answer is: TD learning can lead to biased value function estimates.

Question **4**

Not answered

Marked out of 1.00

How does TD learning differ from Monte Carlo methods in reinforcement learning?

- a. TD learning only considers the final outcome.
- b. TD learning estimates values at each time step.
- c. TD learning uses a fixed learning rate.
- d. TD learning requires a model of the environment.

Your answer is incorrect.

The correct answer is: TD learning estimates values at each time step.

Question **5**

Not answered

Marked out of 1.00

What are some practical applications where SARSA could be effectively employed for reinforcement learning tasks?

- a. SARSA is only applicable to theoretical reinforcement learning scenarios.
- b. Game playing and robotic control.
- c. Image classification and computer vision.
- d. Natural language processing and sentiment analysis.

Your answer is incorrect.

The correct answer is: Game playing and robotic control.

Question **6**

Not answered

Marked out of 1.00

How does SARSA handle continuous action spaces in reinforcement learning?

- a. SARSA uses a different algorithm for continuous action spaces.
- b. SARSA is only suitable for problems with discrete state spaces.
- c. SARSA discretizes the continuous action space.
- d. SARSA cannot be applied to continuous action spaces.

Your answer is incorrect.

The correct answer is: SARSA discretizes the continuous action space.

Question **7**

Not answered

Marked out of 1.00

What does SARSA stand for?

- a. State-Action-Reward-Sarsa
- b. Stochastic Action Reward SARSA
- c. Sequential Actor-Reward State Actor
- d. State-Action-Reward-State-Action

Your answer is incorrect.

The correct answer is: State-Action-Reward-State-Action

Question **8**

Not answered

Marked out of 1.00

What is the primary goal of SARSA in reinforcement learning?

- a. To learn an optimal policy that maximizes the cumulative discounted future rewards.
- b. To maximize the immediate reward in each state.
- c. To prioritize exploration over exploitation.
- d. To minimize the number of actions taken by the agent.

Your answer is incorrect.

The correct answer is: To learn an optimal policy that maximizes the cumulative discounted future rewards.

Question **9**

Not answered

Marked out of 1.00

In Q-learning, how does the exploration strategy affect the learning process?

- a. It ensures that the agent always chooses the greedy action.
- b. It maximizes the immediate reward in each time step.
- c. It balances the trade-off between exploration and exploitation.
- d. It reduces the impact of temporal difference errors.

Your answer is incorrect.

The correct answer is: It balances the trade-off between exploration and exploitation.

Question **10**

Not answered

Marked out of 1.00

What is the role of the epsilon-greedy policy in Q-learning?

- a. It penalizes the agent for taking suboptimal actions.
- b. It discounts future rewards based on the time horizon.
- c. It guarantees finding the optimal policy with certainty.
- d. It introduces exploration by occasionally choosing random actions.

Your answer is incorrect.

The correct answer is: It introduces exploration by occasionally choosing random actions.

Question **11**

Not answered

Marked out of 1.00

In Q-learning, what is the primary objective of the agent during the learning process?

- a. Maximizing the long-term expected return
- b. Balancing the exploration-exploitation trade-off
- c. Minimizing the temporal difference error
- d. Maximizing the immediate reward in each time step

Your answer is incorrect.

The correct answer is: Maximizing the long-term expected return

Question **12**

Not answered

Marked out of 1.00

What is the key difference between SARSA and Q-learning?

- a. SARSA does not use Q-values, only state-action values.
- b. Q-learning and SARSA are essentially the same algorithm with different names.
- c. SARSA updates the Q-value of the current state-action pair, while Q-learning updates the Q-value of the next state-action pair.
- d. SARSA updates the Q-value of the next state-action pair, while Q-learning updates the Q-value of the current state-action pair.

Your answer is incorrect.

The correct answer is: SARSA updates the Q-value of the current state-action pair, while Q-learning updates the Q-value of the next state-action pair.

Question **13**

Not answered

Marked out of 1.00

What does the following line of code achieve in the SARSA algorithm?

```
V = np.max(Q, axis=1)
```

- a. It calculates the cumulative rewards for each episode.
- b. It initializes the Q-values for each state-action pair.
- c. It updates the exploration parameter (epsilon).
- d. It computes the value function for each state.

Your answer is incorrect.

The correct answer is: It computes the value function for each state.

Question **14**

Not answered

Marked out of 1.00

How does the line 'Q[state][action] = Q[state][action] + alphas[e] * td_error' contribute to the SARSA algorithm's convergence over episodes?

```
Q[state][action] = Q[state][action] + alphas[e] * td_error
```

- a. It updates the exploration parameter (epsilon) during training.
- b. It initializes the Q-values for each state-action pair.
- c. It computes the Q-values using the SARSA algorithm for each episode.
- d. It adjusts the Q-values based on the temporal difference error.

Your answer is incorrect.

The correct answer is: It adjusts the Q-values based on the temporal difference error.

Question **15**

Not answered

Marked out of 1.00

What information does the term "Sarsa estimates through time vs. true values" convey in the context of reinforcement learning?

- a. It represents the exploration parameter (epsilon) schedule over time.
- b. It indicates the cumulative rewards for each episode compared to the true values.
- c. It denotes the average Q-values obtained through the SARSA algorithm over the course of training.
- d. It tracks the decay of the learning rate (alpha) through the training process.

Your answer is incorrect.

The correct answer is: It denotes the average Q-values obtained through the SARSA algorithm over the course of training.

Question **16**

Not answered

Marked out of 1.00

What is the purpose of the gym, gym_walk, and gym_aima modules in the code?

```
import itertools
import gym, gym_walk, gym_aima
import numpy as np
from tabulate import tabulate
from pprint import pprint
from tqdm import tqdm_notebook as tqdm
```

- a. They provide environments for reinforcement learning.
- b. They are used for random number generation.
- c. They handle tabular data visualization.
- d. They are used for advanced mathematical computations.

Your answer is incorrect.

The correct answer is: They provide environments for reinforcement learning.

Question **17**

Not answered

Marked out of 1.00

What is the purpose of the select_action function in the given code?

```
select_action = lambda state, Q, epsilon: np.argmax(Q[state]) \
    if np.random.random() > epsilon \
    else np.random.randint(len(Q[state]))
```

- a. It updates the learning rate (alpha) for each episode.
- b. It calculates the optimal policy for a given state.
- c. It initializes the Q-values for each state-action pair.
- d. It selects an action based on the epsilon-greedy policy.

Your answer is incorrect.

The correct answer is: It selects an action based on the epsilon-greedy policy.

Question **18**

Not answered

Marked out of 1.00

How does the `select_action` lambda function contribute to the exploration-exploitation trade-off?

- a. It selects the action with the highest Q-value most of the time, but occasionally explores random actions based on epsilon.
- b. It updates the learning rate (alpha) during the exploration phase.
- c. It chooses a random action with uniform probability.
- d. It always selects the action with the highest Q-value.

Your answer is incorrect.

The correct answer is: It selects the action with the highest Q-value most of the time, but occasionally explores random actions based on epsilon.

Question **19**

Not answered

Marked out of 1.00

Consider a gridworld environment where an agent needs to navigate from the starting point (S) to the goal (G) while avoiding obstacles (X). The agent receives a reward of -1 for each step taken and a reward of +10 upon reaching the goal. Q-learning is employed to train the agent to find an optimal path.

After running Q-learning for several episodes in the gridworld environment, the Q-values for a particular state (5, 3) are as follows: Q((5, 3), UP) = 3.5, Q((5, 3), DOWN) = 1.2, Q((5, 3), LEFT) = 0.8, Q((5, 3), RIGHT) = 2.5. What action is the agent likely to take when in state (5, 3)?

- a. LEFT
- b. DOWN
- c. UP
- d. RIGHT

Your answer is incorrect.

The correct answer is: UP

Question **20**

Not answered

Marked out of 1.00

How does the use of 'np.random.random()' in the 'select_action' function contribute to the exploration-exploitation strategy?

```
select_action = lambda state, Q, epsilon: np.argmax(Q[state]) \
    if np.random.random() > epsilon \
    else np.random.randint(len(Q[state]))
```

- a. It ensures that the Q-value for the next state is considered only if the episode is not done.
- b. It determines the policy by selecting the action with the highest Q-value.
- c. It introduces randomness to occasionally explore actions, based on the epsilon-greedy policy.
- d. It sets the discount factor for future rewards.

Your answer is incorrect.

The correct answer is: It introduces randomness to occasionally explore actions, based on the epsilon-greedy policy.

Unit-IV Questions ►

Started on	Saturday, 23 November 2024, 8:40 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:40 AM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the main advantage of Temporal Difference (TD) learning over Monte Carlo methods in terms of efficiency and real-time learning?

- a. TD learning provides more accurate value function estimates.
- b. TD learning does not require a model of the environment.
- c. TD learning reduces the need for exploration.
- d. TD learning updates value estimates after each time step.

Your answer is incorrect.

The correct answer is: TD learning updates value estimates after each time step.

Question **2**

Not answered

Marked out of 1.00

In Temporal Difference (TD) learning, what does the term "temporal difference" refer to?

- a. The difference between the estimated value of two consecutive states.
- b. The difference between the reward received at two consecutive time steps.
- c. The difference between the discounted future reward and the immediate reward.
- d. The difference between the predicted and actual reward received at the same time.

Your answer is incorrect.

The correct answer is: The difference between the reward received at two consecutive time steps.

Question **3**

Not answered

Marked out of 1.00

In TD learning, what is the role of the learning rate (α)?

- a. It determines the discount factor
- b. It defines the probability of taking a specific action
- c. It adjusts the rate at which the value function is updated
- d. It controls the exploration-exploitation trade-off

Your answer is incorrect.

The correct answer is: It adjusts the rate at which the value function is updated

Question **4**

Not answered

Marked out of 1.00

What role does the discount factor (γ) play in TD learning?

- a. It discounts future rewards to account for their uncertainty
- b. It determines the speed of convergence
- c. It controls the exploration-exploitation trade-off
- d. It adjusts the learning rate during training

Your answer is incorrect.

The correct answer is: It discounts future rewards to account for their uncertainty

Question **5**

Not answered

Marked out of 1.00

In the SARSA algorithm, what does the term "on-policy" refer to?

- a. It signifies the discount factor used
- b. It specifies the number of episodes during training
- c. It indicates the exploration strategy
- d. It refers to the policy that is being learned

Your answer is incorrect.

The correct answer is: It refers to the policy that is being learned

Question **6**

Not answered

Marked out of 1.00

Which of the following is a characteristic of the SARSA algorithm?

- a. It requires a model of the environment dynamics
- b. It updates the Q-values based on the maximum Q-value of the next state
- c. It is an off-policy algorithm
- d. It only considers immediate rewards

Your answer is incorrect.

The correct answer is: It updates the Q-values based on the maximum Q-value of the next state

Question **7**

Not answered

Marked out of 1.00

When is SARSA particularly useful in reinforcement learning tasks?

- a. In tasks where on-policy learning is essential
- b. In episodic tasks with a fixed number of time steps
- c. In scenarios with continuous state and action spaces
- d. In environments with a deterministic dynamics model

Your answer is incorrect.

The correct answer is: In tasks where on-policy learning is essential

Question **8**

Not answered

Marked out of 1.00

How does SARSA handle continuous action spaces in reinforcement learning?

- a. SARSA uses a different algorithm for continuous action spaces.
- b. SARSA cannot be applied to continuous action spaces.
- c. SARSA discretizes the continuous action space.
- d. SARSA is only suitable for problems with discrete state spaces.

Your answer is incorrect.

The correct answer is: SARSA discretizes the continuous action space.

Question **9**

Not answered

Marked out of 1.00

What is the key difference between SARSA and Q-learning?

- a. SARSA updates the Q-value of the next state-action pair, while Q-learning updates the Q-value of the current state-action pair.
- b. Q-learning and SARSA are essentially the same algorithm with different names.
- c. SARSA does not use Q-values, only state-action values.
- d. SARSA updates the Q-value of the current state-action pair, while Q-learning updates the Q-value of the next state-action pair.

Your answer is incorrect.

The correct answer is: SARSA updates the Q-value of the current state-action pair, while Q-learning updates the Q-value of the next state-action pair.

Question **10**

Not answered

Marked out of 1.00

In Q-learning, what does it mean to be "off-policy"?

- a. It means using a fixed, deterministic policy for exploration.
- b. It refers to learning from the same policy used to select actions.
- c. It indicates that Q-values are updated without considering future rewards.
- d. It implies that learning is based on a different policy from the one followed.

Your answer is incorrect.

The correct answer is: It implies that learning is based on a different policy from the one followed.

Question **11**

Not answered

Marked out of 1.00

In Q-learning, what is the primary objective of the agent during the learning process?

- a. Maximizing the long-term expected return
- b. Maximizing the immediate reward in each time step
- c. Minimizing the temporal difference error
- d. Balancing the exploration-exploitation trade-off

Your answer is incorrect.

The correct answer is: Maximizing the long-term expected return

Question **12**

Not answered

Marked out of 1.00

What does the Q-function in Q-learning represent?

- a. The expected cumulative reward for taking a specific action in a given state.
- b. The probability of taking a specific action in a given state.
- c. The immediate reward received after taking an action.
- d. The optimal policy for reaching the goal state from any given state.

Your answer is incorrect.

The correct answer is: The expected cumulative reward for taking a specific action in a given state.

Question **13**

Not answered

Marked out of 1.00

What does the term "td_target" represent in the SARSA algorithm, and how is it calculated in the provided code?

```
td_target = reward + gamma * Q[next_state][next_action] * (not done)
td_error = td_target - Q[state][action]
```

- a. It represents the target Q-value for the current state and action.
- b. It computes the value function (V) for each state.
- c. It tracks the cumulative rewards for each episode.
- d. It updates the exploration parameter (epsilon).

Your answer is incorrect.

The correct answer is: It represents the target Q-value for the current state and action.

Question **14**

Not answered

Marked out of 1.00

How does First Visit Monte Carlo handle episodes where a state is revisited after its first occurrence?

- a. It recalculates the optimal policy for the state.
- b. It updates the Q-values for every visit to the state.
- c. It resets the exploration parameter (epsilon) for the state.
- d. It ignores any subsequent visits to the state in the same episode.

Your answer is incorrect.

The correct answer is: It ignores any subsequent visits to the state in the same episode.

Question **15**

Not answered

Marked out of 1.00

What role do the SEEDS play in the provided code?

```
import random
import matplotlib
import matplotlib.pyplot as plt
import matplotlib.pylab as pylab
SEEDS = (12, 34, 56, 78, 90)
```

- a. They control the verbosity of warning messages.
- b. They determine the color palette for matplotlib plots.
- c. They set the random seeds for reproducibility.
- d. They specify the size of the tabulated data.

Your answer is incorrect.

The correct answer is: They set the random seeds for reproducibility.

Question **16**

Not answered

Marked out of 1.00

How is the exploration-exploitation strategy influenced by the following line in the `sarsa` function?

```
select_action = lambda state, Q, epsilon: np.argmax(Q[state]) \
    if np.random.random() > epsilon \
    else np.random.randint(len(Q[state]))
```

- a. It enforces a strict exploitation strategy throughout training.
- b. It introduces randomness by choosing a random action with probability epsilon.
- c. It gradually increases the exploration rate during training.
- d. It ensures that the agent always selects the action with the highest Q-value.

Your answer is incorrect.

The correct answer is: It introduces randomness by choosing a random action with probability epsilon.

Question **17**

Not answered

Marked out of 1.00

Explain the significance of the term td_error in the context of Q-learning, and how does it influence the update of Q-values?

- a. It controls the learning rate (alpha) during the exploration phase.
- b. 'td_error' represents the reward obtained in the current state and directly updates the Q-values.
- c. The 'td_error' term ensures that the Q-value for the next state is considered only if the episode is not done.
- d. It calculates the temporal difference error, indicating the discrepancy between the predicted and actual rewards.

Your answer is incorrect.

The correct answer is: It calculates the temporal difference error, indicating the discrepancy between the predicted and actual rewards.

Question **18**

Not answered

Marked out of 1.00

What is the purpose of the condition 'if t >= max_steps - 1:' in the function 'generate_trajectory'?

```
experience = (state, action, reward, next_state, done)
trajectory.append(experience)
if done:
    break
if t >= max_steps - 1:
    trajectory = []
    break
state = next_state
```

- a. To limit the number of steps in each trajectory
- b. To visualize the agent's trajectory in the environment
- c. To terminate the trajectory when the agent reaches the goal state
- d. To reset the environment and generate a new trajectory

Your answer is incorrect.

The correct answer is: To limit the number of steps in each trajectory

Question **19**

Not answered

Marked out of 1.00

What does the term td_target represent in the context of the code?

```
td_target = reward + gamma * Q[next_state].max() * (not done)
td_error = td_target - Q[state][action]
Q[state][action] = Q[state][action] + alphas[e] * td_error
state = next_state
```

- a. It is the reward obtained in the current state.
- b. It determines the target value for updating the Q-values.
- c. It calculates the temporal difference error.
- d. It is the maximum Q-value of the next state.

Your answer is incorrect.

The correct answer is: It determines the target value for updating the Q-values.

Question **20**

Not answered

Marked out of 1.00

How does the `select_action` lambda function contribute to the exploration-exploitation trade-off?

- a. It chooses a random action with uniform probability.
- b. It selects the action with the highest Q-value most of the time, but occasionally explores random actions based on epsilon.
- c. It always selects the action with the highest Q-value.
- d. It updates the learning rate (alpha) during the exploration phase.

Your answer is incorrect.

The correct answer is: It selects the action with the highest Q-value most of the time, but occasionally explores random actions based on epsilon.

Time taken	11 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In TD learning, what does the term "bootstrapping" refer to?

- a. Using the estimated value of a state to update the value of another state
- b. Restarting the learning process when convergence is not reached
- c. Using reinforcement learning with deep neural networks
- d. Employing advanced exploration strategies

Your answer is incorrect.

The correct answer is: Using the estimated value of a state to update the value of another state

Question **2**

Not answered

Marked out of 1.00

In TD learning, what does the term "temporal difference" refer to?

- a. The duration of an episode in a reinforcement learning task
- b. The difference between predicted and actual rewards at a given time step
- c. The time it takes for a neural network to converge during training
- d. The time it takes for an agent to make a decision

Your answer is incorrect.

The correct answer is: The difference between predicted and actual rewards at a given time step

Question **3**

Not answered

Marked out of 1.00

Which of the following is a potential drawback of TD learning in some environments?

- a. TD learning is computationally expensive and slow.
- b. TD learning is only effective in fully observable environments.
- c. TD learning can lead to biased value function estimates.
- d. TD learning doesn't utilize any exploration strategies.

Your answer is incorrect.

The correct answer is: TD learning can lead to biased value function estimates.

Question **4**

Not answered

Marked out of 1.00

How does TD learning differ from Monte Carlo methods in reinforcement learning?

- a. TD learning estimates values at each time step.
- b. TD learning uses a fixed learning rate.
- c. TD learning only considers the final outcome.
- d. TD learning requires a model of the environment.

Your answer is incorrect.

The correct answer is: TD learning estimates values at each time step.

Question **5**

Not answered

Marked out of 1.00

In the SARSA algorithm, what does the term "on-policy" refer to?

- a. It signifies the discount factor used
- b. It indicates the exploration strategy
- c. It refers to the policy that is being learned
- d. It specifies the number of episodes during training

Your answer is incorrect.

The correct answer is: It refers to the policy that is being learned

Question **6**

Not answered

Marked out of 1.00

What are some practical applications where SARSA could be effectively employed for reinforcement learning tasks?

- a. Natural language processing and sentiment analysis.
- b. Game playing and robotic control.
- c. SARSA is only applicable to theoretical reinforcement learning scenarios.
- d. Image classification and computer vision.

Your answer is incorrect.

The correct answer is: Game playing and robotic control.

Question **7**

Not answered

Marked out of 1.00

How does SARSA adapt to dynamic environments where the optimal policy changes over time?

- a. SARSA relies on external signals to trigger policy updates.
- b. SARSA automatically adjusts to changes in the environment without additional modifications.
- c. SARSA is not well-suited for dynamic environments.
- d. SARSA requires periodic retraining from scratch.

Your answer is incorrect.

The correct answer is: SARSA is not well-suited for dynamic environments.

Question **8**

Not answered

Marked out of 1.00

Which of the following is a characteristic of the SARSA algorithm?

- a. It requires a model of the environment dynamics
- b. It is an off-policy algorithm
- c. It only considers immediate rewards
- d. It updates the Q-values based on the maximum Q-value of the next state

Your answer is incorrect.

The correct answer is: It updates the Q-values based on the maximum Q-value of the next state

Question **9**

Not answered

Marked out of 1.00

What is the role of the epsilon-greedy policy in Q-learning?

- a. It guarantees finding the optimal policy with certainty.
- b. It discounts future rewards based on the time horizon.
- c. It penalizes the agent for taking suboptimal actions.
- d. It introduces exploration by occasionally choosing random actions.

Your answer is incorrect.

The correct answer is: It introduces exploration by occasionally choosing random actions.

Question **10**

Not answered

Marked out of 1.00

Which of the following is NOT a key element of the Q-learning update rule?

- a. Learning rate parameter
- b. Current Q-value of the chosen action
- c. Reward received after taking the action
- d. Estimated Q-value of the next state reached

Your answer is incorrect.

The correct answer is: Learning rate parameter

Question **11**

Not answered

Marked out of 1.00

In Q-learning, how does the exploration strategy affect the learning process?

- a. It ensures that the agent always chooses the greedy action.
- b. It balances the trade-off between exploration and exploitation.
- c. It reduces the impact of temporal difference errors.
- d. It maximizes the immediate reward in each time step.

Your answer is incorrect.

The correct answer is: It balances the trade-off between exploration and exploitation.

Question **12**

Not answered

Marked out of 1.00

What is the fundamental goal of Q-learning in reinforcement learning?

- a. Balancing state-action pairs for equal exploration.
- b. Prioritizing immediate rewards over long-term gains.
- c. Minimizing the exploration-exploitation trade-off.
- d. Learning an optimal policy to maximize cumulative rewards.

Your answer is incorrect.

The correct answer is: Learning an optimal policy to maximize cumulative rewards.

Question **13**

Not answered

Marked out of 1.00

In First Visit Monte Carlo, what is the primary criterion for determining whether a state has been visited for the first time in an episode?

- a. Whether the state has been encountered earlier in the episode.
- b. Whether the state has the highest Q-value.
- c. The cumulative rewards obtained in the state.
- d. The state's location in the environment.

Your answer is incorrect.

The correct answer is: Whether the state has been encountered earlier in the episode.

Question **14**

Not answered

Marked out of 1.00

What is the significance of the 'min_epsilon' parameter in the sarsa function?

```
def sarsa(env,
          gamma=1.0,
          init_alpha=0.5,
          min_alpha=0.01,
          alpha_decay_ratio=0.5,
          init_epsilon=1.0,
          min_epsilon=0.1,
          epsilon_decay_ratio=0.9,
          n_episodes=3000):
```

- a. It defines the minimum value for the learning rate (alpha).
- b. It determines the minimum value for the exploration parameter during decay.
- c. It sets the initial value for the exploration parameter (epsilon).
- d. It specifies the discount factor for future rewards.

Your answer is incorrect.

The correct answer is: It determines the minimum value for the exploration parameter during decay.

Question **15**

Not answered

Marked out of 1.00

What is the role of the 'pi' lambda function in the provided code?

```
pi = lambda s: {s:a for s, a in enumerate(np.argmax(Q, axis=1))}[s]
```

- a. It tracks the selected actions in each episode.
- b. It updates the exploration parameter (epsilon).
- c. It computes the optimal policy for a given state.
- d. It defines the decay schedule for the learning rate (alpha).

Your answer is incorrect.

The correct answer is: It computes the optimal policy for a given state.

Question **16**

Not answered

Marked out of 1.00

What is the purpose of the gym, gym_walk, and gym_aima modules in the code?

```
import itertools
import gym, gym_walk, gym_aima
import numpy as np
from tabulate import tabulate
from pprint import pprint
from tqdm import tqdm_notebook as tqdm
```

- a. They are used for random number generation.
- b. They are used for advanced mathematical computations.
- c. They handle tabular data visualization.
- d. They provide environments for reinforcement learning.

Your answer is incorrect.

The correct answer is: They provide environments for reinforcement learning.

Question **17**

Not answered

Marked out of 1.00

What is the primary purpose of the function generate_trajectory?

```
def generate_trajectory(select_action, Q, epsilon, env, max_steps=200):
    done, trajectory = False, []
    while not done:
        state = env.reset()
        for t in count():
            action = select_action(state, Q, epsilon)
            next_state, reward, done, _ = env.step(action)
            experience = (state, action, reward, next_state, done)
            trajectory.append(experience)
```

- a. To calculate the total reward obtained during a trajectory
- b. To generate a sequence of experiences using a given action selection strategy
- c. To reset the environment and generate random trajectories
- d. To visualize the agent's trajectory in the environment

Your answer is incorrect.

The correct answer is: To generate a sequence of experiences using a given action selection strategy

Question **18**

Not answered

Marked out of 1.00

How is the variable `td_error` calculated in the code?

- a. td_error = gamma * Q[next_state].max() * (not done) - reward
- b. td_error = gamma * Q[next_state].max() - Q[state][action]
- c. td_error = reward - Q[state][action]
- d. td_error = reward + gamma * Q[next_state].max() * (not done) - Q[state][action]

Your answer is incorrect.

The correct answer is: td_error = reward + gamma * Q[next_state].max() * (not done) - Q[state][action]

Question **19**

Not answered

Marked out of 1.00

What does the line 'Q[state][action] = Q[state][action] + alphas[e] * td_error' do?

- a. Sets the Q-value to a constant value
- b. Modifies the reward for the current state-action pair
- c. Adjusts the exploration factor based on the temporal difference error
- d. Updates the Q-value using the Bellman equation

Your answer is incorrect.

The correct answer is: Updates the Q-value using the Bellman equation

Question **20**

Not answered

Marked out of 1.00

In the code snippet, what does the variable 'Q' likely represent?

```
def generate_trajectory(select_action, Q, epsilon, env, max_steps=200):
    done, trajectory = False, []
    while not done:
        state = env.reset()
        for t in count():
            action = select_action(state, Q, epsilon)
            next_state, reward, done, _ = env.step(action)
            experience = (state, action, reward, next_state, done)
            trajectory.append(experience)
```

- a. The state-action values in a Q-table
- b. The discount factor for future rewards
- c. The precision parameter for rounding
- d. The agent's learning rate

Your answer is incorrect.

The correct answer is: The state-action values in a Q-table

Unit-IV Questions ►

Started on	Saturday, 23 November 2024, 8:41 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:41 AM
Time taken	9 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the role of the discount factor (γ) in TD learning?

- a. It determines the learning rate of the algorithm.
- b. It guarantees the convergence of the value estimates.
- c. It controls the trade-off between immediate and future rewards.
- d. It prevents the algorithm from getting stuck in cycles.

Your answer is incorrect.

The correct answer is: It controls the trade-off between immediate and future rewards.

Question **2**

Not answered

Marked out of 1.00

In TD(0) learning, what is the update rule for the value function?

- a. $V(s)=R+\gamma\cdot V(s')-V(s)$
- b. $V(s)=R+\gamma\cdot V(s')$
- c. $V(s)=R+\alpha\cdot V(s')$
- d. $V(s)=R+\alpha\cdot(R+\gamma\cdot V(s')-V(s))$

Your answer is incorrect.

The correct answer is: $V(s)=R+\gamma\cdot V(s')$

Question **3**

Not answered

Marked out of 1.00

Which of the following is a potential drawback of TD learning in some environments?

- a. TD learning is computationally expensive and slow.
- b. TD learning can lead to biased value function estimates.
- c. TD learning doesn't utilize any exploration strategies.
- d. TD learning is only effective in fully observable environments.

Your answer is incorrect.

The correct answer is: TD learning can lead to biased value function estimates.

Question **4**

Not answered

Marked out of 1.00

What is the main advantage of Temporal Difference (TD) learning over Monte Carlo methods in terms of efficiency and real-time learning?

- a. TD learning updates value estimates after each time step.
- b. TD learning provides more accurate value function estimates.
- c. TD learning reduces the need for exploration.
- d. TD learning does not require a model of the environment.

Your answer is incorrect.

The correct answer is: TD learning updates value estimates after each time step.

Question **5**

Not answered

Marked out of 1.00

What does SARSA stand for in reinforcement learning?

- a. State-Action-Reward-State-Advantage
- b. State-Action-Reinforcement-State-Action
- c. State-Action-Reward-State-Action
- d. State-Aggregate-Reward-Strategy

Your answer is incorrect.

The correct answer is: State-Action-Reward-State-Action

Question **6**

Not answered

Marked out of 1.00

What does SARSA stand for?

- a. Stochastic Action Reward SARSA
- b. State-Action-Reward-State-Action
- c. Sequential Actor-Reward State Actor
- d. State-Action-Reward-Sarsa

Your answer is incorrect.

The correct answer is: State-Action-Reward-State-Action

Question **7**

Not answered

Marked out of 1.00

What is the primary goal of SARSA in reinforcement learning?

- a. To prioritize exploration over exploitation.
- b. To minimize the number of actions taken by the agent.
- c. To learn an optimal policy that maximizes the cumulative discounted future rewards.
- d. To maximize the immediate reward in each state.

Your answer is incorrect.

The correct answer is: To learn an optimal policy that maximizes the cumulative discounted future rewards.

Question **8**

Not answered

Marked out of 1.00

What is the purpose of the epsilon-greedy strategy in SARSA?

- a. To encourage exploration by choosing a random action with probability epsilon.
- b. To always choose the action with the highest Q-value.
- c. To reduce the impact of rewards in the learning process.
- d. To punish the agent for choosing suboptimal actions.

Your answer is incorrect.

The correct answer is: To encourage exploration by choosing a random action with probability epsilon.

Question **9**

Not answered

Marked out of 1.00

What is the drawback of using a high exploration rate in Q-learning?

- a. Slower convergence to the optimal policy.
- b. Increased risk of overfitting to the training data.
- c. Greater likelihood of getting stuck in local optima.
- d. The possibility of missing important state-action pairs.

Your answer is incorrect.

The correct answer is: Slower convergence to the optimal policy.

Question **10**

Not answered

Marked out of 1.00

In Q-learning, what does the Q-value represent for a given state-action pair?

- a. The probability of taking the given action in the current state.
- b. The frequency of selecting the given action in the current state.
- c. The immediate reward obtained by taking the given action in the current state.
- d. The cumulative discounted future rewards of taking the given action in the current state.

Your answer is incorrect.

The correct answer is: The cumulative discounted future rewards of taking the given action in the current state.

Question **11**

Not answered

Marked out of 1.00

What is the role of the epsilon-greedy policy in Q-learning?

- a. It discounts future rewards based on the time horizon.
- b. It guarantees finding the optimal policy with certainty.
- c. It penalizes the agent for taking suboptimal actions.
- d. It introduces exploration by occasionally choosing random actions.

Your answer is incorrect.

The correct answer is: It introduces exploration by occasionally choosing random actions.

Question **12**

Not answered

Marked out of 1.00

Which of the following is NOT a key element of the Q-learning update rule?

- a. Current Q-value of the chosen action
- b. Learning rate parameter
- c. Reward received after taking the action
- d. Estimated Q-value of the next state reached

Your answer is incorrect.

The correct answer is: Learning rate parameter

Question **13**

Not answered

Marked out of 1.00

What information does the line 'Q[state][action] = Q[state][action] + alphas[e] * td_error' provide about the SARSA algorithm?

```
td_error = td_target - Q[state][action]
Q[state][action] = Q[state][action] + alphas[e] * td_error
```

- a. It updates the Q-value for the current state-action pair.
- b. It defines the decay schedule for the exploration parameter (epsilon).
- c. It initializes the Q-values for each state-action pair.
- d. It calculates the optimal policy for each state.

Your answer is incorrect.

The correct answer is: It updates the Q-value for the current state-action pair.

Question **14**

Not answered

Marked out of 1.00

In the code snippet return Q, V, pi, Q_track, pi_track, what do the variables Q, V, and pi collectively represent?

- a. They represent the Q-values, value function, and optimal policy for each state.
- b. They track the cumulative rewards for each episode.
- c. They define the learning rates (alpha) for each episode.
- d. They store the exploration parameters (epsilon) during training.

Your answer is incorrect.

The correct answer is: They represent the Q-values, value function, and optimal policy for each state.

Question **15**

Not answered

Marked out of 1.00

In the context of First Visit Monte Carlo (FVMC) methods for reinforcement learning, what is the primary objective?

- a. To estimate the value function by averaging returns from the first visit to each state.
- b. To calculate the optimal policy for a given state.
- c. To update the exploration parameter (epsilon) for each episode.
- d. To initialize the Q-values for each state-action pair.

Your answer is incorrect.

The correct answer is: To estimate the value function by averaging returns from the first visit to each state.

Question **16**

Not answered

Marked out of 1.00

In terms of temporal difference learning, what characterizes the update mechanism in FVMC versus SARSA?

- a. FVMC and SARSA do not involve temporal difference learning.
- b. FVMC estimates returns based on the first visit, while SARSA uses temporal difference errors for Q-value updates.
- c. FVMC uses temporal difference errors for Q-value updates, while SARSA relies on averaging returns.
- d. FVMC and SARSA both use temporal difference errors exclusively for Q-value updates.

Your answer is incorrect.

The correct answer is: FVMC estimates returns based on the first visit, while SARSA uses temporal difference errors for Q-value updates.

Question **17**

Not answered

Marked out of 1.00

How does the q_learning function use the parameters init_alpha, min_alpha, and alpha_decay_ratio collectively?

```
def q_learning(env,
               gamma=1.0,
               init_alpha=0.5,
               min_alpha=0.01,
               alpha_decay_ratio=0.5,
               init_epsilon=1.0,
               min_epsilon=0.1,
               epsilon_decay_ratio=0.9,
               n_episodes=3000):
```

- a. They specify the discount factor for future rewards
- b. They control the verbosity of the tqdm progress bar.
- c. They determine the precision level for the state value function.
- d. They set the initial values for the learning rate.

Your answer is incorrect.

The correct answer is: They set the initial values for the learning rate.

Question **18**

Not answered

Marked out of 1.00

What does the parameter max_steps represent in the context of the decay_schedule function?

- a. The number of steps over which the decay occurs
- b. The maximum value of the decay schedule
- c. The minimum value the decay schedule can reach
- d. The maximum allowable decay ratio

Your answer is incorrect.

The correct answer is: The number of steps over which the decay occurs

Question **19**

Not answered

Marked out of 1.00

What is the purpose of the select_action function in the given code?

```
select_action = lambda state, Q, epsilon: np.argmax(Q[state]) \
    if np.random.random() > epsilon \
    else np.random.randint(len(Q[state]))
```

- a. It selects an action based on the epsilon-greedy policy.
- b. It updates the learning rate (alpha) for each episode.
- c. It initializes the Q-values for each state-action pair.
- d. It calculates the optimal policy for a given state.

Your answer is incorrect.

The correct answer is: It selects an action based on the epsilon-greedy policy.

Question **20**

Not answered

Marked out of 1.00

How does the use of 'np.random.random()' in the 'select_action' function contribute to the exploration-exploitation strategy?

```
select_action = lambda state, Q, epsilon: np.argmax(Q[state]) \
    if np.random.random() > epsilon \
    else np.random.randint(len(Q[state]))
```

- a. It sets the discount factor for future rewards.
- b. It determines the policy by selecting the action with the highest Q-value.
- c. It ensures that the Q-value for the next state is considered only if the episode is not done.
- d. It introduces randomness to occasionally explore actions, based on the epsilon-greedy policy.

Your answer is incorrect.

The correct answer is: It introduces randomness to occasionally explore actions, based on the epsilon-greedy policy.

Unit-IV Questions ►

Started on	Tuesday, 5 November 2024, 10:51 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 10:51 AM
Time taken	19 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the primary purpose of using a utility function in decision-making?

- a. Maximizing risks
- b. Representing preferences and evaluating choices
- c. Minimizing costs
- d. Maximizing profits

The correct answer is: Representing preferences and evaluating choices

Question **2**

Not answered

Marked out of 1.00

What is the objective of solving an MDP?

- a. Maximizing the number of states
- b. Finding the optimal policy to maximize cumulative rewards
- c. Achieving deterministic outcomes
- d. Minimizing the number of actions

The correct answer is: Finding the optimal policy to maximize cumulative rewards

Question **3**

Not answered

Marked out of 1.00

What is the key consideration in determining the Value of Information in decision-making?

- a. The cost of information acquisition
- b. The impact of information on decision uncertainty
- c. The source of information
- d. The quantity of information available

The correct answer is: The cost of information acquisition

Question **4**

Not answered

Marked out of 1.00

In Multiattribute Utility Functions, what does the term "dominance" refer to?

- a. The dominance of costs over benefits
- b. The dominance of preferences over risks
- c. The dominance of one alternative over another in terms of overall utility
- d. The dominance of one attribute over another

The correct answer is: The dominance of one alternative over another in terms of overall utility

Question **5**

Not answered

Marked out of 1.00

In utility theory, what does the term "risk aversion" refer to?

- a. Maximizing profits
- b. Ignoring risks
- c. Preferring riskier options
- d. Preferring certain outcomes over risky ones

The correct answer is: Preferring certain outcomes over risky ones

Question **6**

Not answered

Marked out of 1.00

What is the primary purpose of Utility Nodes in a Decision Network?

- a. To represent uncertain events
- b. To calculate probabilities
- c. To represent decisions
- d. To quantify the desirability of different outcomes

The correct answer is: To quantify the desirability of different outcomes

Question **7**

Not answered

Marked out of 1.00

In Decision Networks, what is the primary function of a Chance Node?

- a. Calculating probabilities
- b. Representing events with uncertain outcomes
- c. Quantifying utility values
- d. Representing decisions

The correct answer is: Representing events with uncertain outcomes

Question **8**

Not answered

Marked out of 1.00

In non-cooperative games, what is the concept of dominant strategy?

- a. A strategy that requires cooperation with other players
- b. A strategy that minimizes the risk of loss
- c. A strategy that is always optimal, regardless of opponents' choices
- d. A strategy that maximizes the total payoff for all players

The correct answer is: A strategy that is always optimal, regardless of opponents' choices

Question **9**

Not answered

Marked out of 1.00

What is the primary purpose of Decision Networks in artificial intelligence and decision analysis?

- a. Image processing
- b. Speech recognition
- c. Game playing
- d. Representing and solving decision problems

The correct answer is: Representing and solving decision problems

Question **10**

Not answered

Marked out of 1.00

Which algorithm is commonly used to solve finite-horizon MDPs with a known horizon?

- a. Deep Neural Networks
- b. Q-Learning
- c. Monte Carlo Simulation
- d. Value Iteration

The correct answer is: Value Iteration

Question **11**

Not answered

Marked out of 1.00

What type of nodes in a Decision Network represent events with known probabilities?

- a. Information Nodes
- b. Chance Nodes
- c. Utility Nodes
- d. Decision Nodes

The correct answer is: Chance Nodes

Question **12**

Not answered

Marked out of 1.00

What does MDP stand for in the context of Artificial Intelligence?

- a. Memory Decision Principle
- b. Machine Decision Process
- c. Markov Decision Process
- d. Model Decision Protocol

The correct answer is: Markov Decision Process

Question **13**

Not answered

Marked out of 1.00

Which axiom asserts that preferences should be consistent across different scenarios or contexts?

- a. Axiom of Irrelevance
- b. Axiom of Continuity
- c. Axiom of Consistency
- d. Axiom of Independence

The correct answer is: Axiom of Consistency

Question **14**

Not answered

Marked out of 1.00

The Axiom of Convexity asserts that if an individual is indifferent between two options, then they should also be indifferent between:

- a. Any linear combination of the two options
- b. Any concave combination of the two options
- c. Any convex combination of the two options
- d. Any non-linear combination of the two options

The correct answer is: Any convex combination of the two options

Question **15**

Not answered

Marked out of 1.00

Which axiom states that if an individual is indifferent between options A and B, and also indifferent between B and C, then they should be indifferent between A and C?

- a. Axiom of Independence
- b. Axiom of Continuity
- c. Axiom of Completeness
- d. Axiom of Transitivity

The correct answer is: Axiom of Transitivity

Question **16**

Not answered

Marked out of 1.00

What is the key assumption about individuals in utility theory?

- a. Individuals always maximize profits
- b. Individuals have consistent and transitive preferences
- c. Individuals always make irrational decisions
- d. Preferences of individuals are irrelevant

The correct answer is: Individuals have consistent and transitive preferences

Question **17**

Not answered

Marked out of 1.00

What does the Axiom of Continuity state about preferences?

- a. Preferences are continuous and smooth
- b. Preferences are independent of irrelevant alternatives
- c. Preferences are indifferent
- d. Preferences are complete and transitive

The correct answer is: Preferences are continuous and smooth

Question **18**

Not answered

Marked out of 1.00

What is utility theory primarily concerned with in decision-making?

- a. Maximizing profits
- b. Minimizing risks
- c. Minimizing costs
- d. Maximizing satisfaction or well-being

The correct answer is: Maximizing satisfaction or well-being

Question **19**

Not answered

Marked out of 1.00

What are the three main components of an MDP?

- a. Transitions, States, Rewards
- b. States, Actions, Rewards
- c. Actions, Rewards, Observations
- d. States, Observations, Transitions

The correct answer is: States, Actions, Rewards

Question **20**

Not answered

Marked out of 1.00

In Multiattribute Utility Functions, how are the individual utility functions for different attributes combined?

- a. Ignoring
- b. Averaging
- c. Multiplying
- d. Summing

The correct answer is: Summing

Unit 3 :Part -BC ►

Started on	Saturday, 23 November 2024, 8:42 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:43 AM
Time taken	9 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

According to the Axiom of Non-satiation, individuals prefer:

- a. Indifference
- b. More of a good to less
- c. Higher costs
- d. Lower satisfaction

The correct answer is: More of a good to less

Question **2**

Not answered

Marked out of 1.00

In decision analysis, what does the term "Irrelevance of Information" imply?

- a. Information is only relevant if it is costly to obtain
- b. Additional information cannot change the decision
- c. Decision-makers should ignore all available information
- d. Information is always irrelevant in decision-making

The correct answer is: Additional information cannot change the decision

Question **3**

Not answered

Marked out of 1.00

What is the objective of solving an MDP?

- a. Maximizing the number of states
- b. Minimizing the number of actions
- c. Achieving deterministic outcomes
- d. Finding the optimal policy to maximize cumulative rewards

The correct answer is: Finding the optimal policy to maximize cumulative rewards

Question **4**

Not answered

Marked out of 1.00

In the context of Value of Information, what does "Information Asymmetry" refer to?

- a. The exclusion of decision-makers from the information-sharing process
- b. The irrelevance of information in decision-making
- c. The unequal distribution of information among decision-makers
- d. The equal distribution of information among decision-makers

The correct answer is: The unequal distribution of information among decision-makers

Question **5**

Not answered

Marked out of 1.00

What does MDP stand for in the context of Artificial Intelligence?

- a. Markov Decision Process
- b. Model Decision Protocol
- c. Memory Decision Principle
- d. Machine Decision Process

The correct answer is: Markov Decision Process

Question **6**

Not answered

Marked out of 1.00

How is the Value of Perfect Information (VPI) calculated?

- a. By dividing the expected utility with perfect information by the expected utility without information
- b. By ignoring the impact of perfect information on decision-making
- c. By multiplying the probability of making a correct decision by the cost of information
- d. By subtracting the expected utility with perfect information from the expected utility without information

The correct answer is: By subtracting the expected utility with perfect information from the expected utility without information

Question **7**

Not answered

Marked out of 1.00

How does a Decision Network handle the concept of conditional probability?

- a. By excluding uncertain events
- b. Through the use of decision nodes
- c. By relying solely on utility nodes
- d. Through chance nodes and probability tables

The correct answer is: Through chance nodes and probability tables

Question **8**

Not answered

Marked out of 1.00

In a Decision Network, what is represented by a Decision Node?

- a. Decisions that can be made
- b. Utility values
- c. Uncertain events
- d. Probabilities

The correct answer is: Decisions that can be made

Question **9**

Not answered

Marked out of 1.00

What is the primary purpose of using Multiattribute Utility Functions (MAUFs) in decision-making?

- a. Incorporating preferences over multiple attributes
- b. Ignoring preferences
- c. Maximizing costs
- d. Minimizing risks

The correct answer is: Incorporating preferences over multiple attributes

Question **10**

Not answered

Marked out of 1.00

The Axiom of Independence suggests that preferences should not be influenced by:

- a. Irrelevant alternatives
- b. Continuity
- c. Completeness
- d. Transitivity

The correct answer is: Irrelevant alternatives

Question **11**

Not answered

Marked out of 1.00

How is utility typically measured in utility theory?

- a. In units of satisfaction or happiness
- b. In dollars
- c. In terms of risks
- d. In percentages

The correct answer is: In units of satisfaction or happiness

Question **12**

Not answered

Marked out of 1.00

In an MDP, what does the term "Markov" refer to?

- a. Sequential decision-making
- b. Deterministic outcomes
- c. Independence of past events
- d. Randomness

The correct answer is: Independence of past events

Question **13**

Not answered

Marked out of 1.00

How does a rational decision-maker choose between two options based on utility theory?

- a. By comparing the utilities of each option and choosing the one with higher utility
- b. By selecting the option with the lowest risk
- c. By ignoring preferences and choosing randomly
- d. By selecting the option with the highest cost

The correct answer is: By comparing the utilities of each option and choosing the one with higher utility

Question **14**

Not answered

Marked out of 1.00

What is the exploration-exploitation trade-off in the context of MDPs?

- a. Choosing between random and deterministic actions
- b. Managing the trade-off between immediate and future rewards
- c. Balancing between state and action spaces
- d. Striking a balance between exploring new actions and exploiting known actions

The correct answer is: Striking a balance between exploring new actions and exploiting known actions

Question **15**

Not answered

Marked out of 1.00

In cooperative games, what is the core of a game?

- a. The set of stable payoff allocations that no subgroup can improve upon
- b. The set of dominant strategies
- c. The set of Nash equilibria
- d. The set of all possible strategies

The correct answer is: The set of stable payoff allocations that no subgroup can improve upon

Question **16**

Not answered

Marked out of 1.00

What is the main feature of non-cooperative games in AI?

- a. Players act independently and pursue individual interests
- b. Players have complete information about each other's strategies
- c. Players collaborate to achieve common goals
- d. Players always follow a central authority's decisions

The correct answer is: Players act independently and pursue individual interests

Question **17**

Not answered

Marked out of 1.00

What are the three main components of an MDP?

- a. States, Observations, Transitions
- b. States, Actions, Rewards
- c. Actions, Rewards, Observations
- d. Transitions, States, Rewards

The correct answer is: States, Actions, Rewards

Question **18**

Not answered

Marked out of 1.00

What is the discount factor in MDPs used for?

- a. Controlling the randomness of the environment
- b. Defining the optimal policy
- c. Adjusting the magnitude of rewards
- d. Balancing the trade-off between immediate and future rewards

The correct answer is: Balancing the trade-off between immediate and future rewards

Question **19**

Not answered

Marked out of 1.00

In MDPs, what is the purpose of the transition model?

- a. Defines the possible states of the system
- b. Determines the available actions in each state
- c. Describes the probability of moving from one state to another
- d. Specifies the rewards associated with each state-action pair

The correct answer is: Describes the probability of moving from one state to another

Question **20**

Not answered

Marked out of 1.00

What is the main characteristic of cooperative games in AI?

- a. Players act independently
- b. Players compete without communication
- c. Players follow a predetermined strategy
- d. Players collaborate to achieve common goals

The correct answer is: Players collaborate to achieve common goals

Unit 3 :Part -BC ►

Started on	Saturday, 23 November 2024, 8:43 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:43 AM
Time taken	11 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the exploration-exploitation trade-off in the context of MDPs?

- a. Striking a balance between exploring new actions and exploiting known actions
- b. Choosing between random and deterministic actions
- c. Balancing between state and action spaces
- d. Managing the trade-off between immediate and future rewards

The correct answer is: Striking a balance between exploring new actions and exploiting known actions

Question **2**

Not answered

Marked out of 1.00

What is the Nash equilibrium in non-cooperative game theory?

- a. A strategy profile where no player has an incentive to deviate unilaterally
- b. A situation where players take turns making decisions
- c. A strategy that guarantees a player the highest payoff regardless of others' choices
- d. A situation where all players cooperate for mutual benefit

The correct answer is: A strategy profile where no player has an incentive to deviate unilaterally

Question **3**

Not answered

Marked out of 1.00

In MDPs, what is the purpose of the transition model?

- a. Determines the available actions in each state
- b. Defines the possible states of the system
- c. Specifies the rewards associated with each state-action pair
- d. Describes the probability of moving from one state to another

The correct answer is: Describes the probability of moving from one state to another

Question **4**

Not answered

Marked out of 1.00

Which of the following statements best describes the concept of diminishing marginal utility?

- a. Utility is independent of quantity
- b. Additional units provide decreasing additional satisfaction
- c. Marginal utility remains constant
- d. Marginal utility increases with quantity

The correct answer is: Additional units provide decreasing additional satisfaction

Question **5**

Not answered

Marked out of 1.00

What is the term for the process of computing the probability of an event given the evidence in a Decision Network?

- a. Utility calculation
- b. Probability propagation
- c. Decision modeling
- d. Decision analysis

The correct answer is: Probability propagation

Question **6**

Not answered

Marked out of 1.00

How are relationships between nodes typically represented in a Decision Network?

- a. Through decision trees
- b. Through undirected edges
- c. Through directed edges or arrows
- d. Through probability tables

The correct answer is: Through directed edges or arrows

Question **7**

Not answered

Marked out of 1.00

What does the term "Value of Information" refer to in decision theory?

- a. The monetary value associated with uncertain outcomes
- b. The usefulness of already available information
- c. The benefit of obtaining additional information before making a decision
- d. The cost of acquiring information

The correct answer is: The benefit of obtaining additional information before making a decision

Question **8**

Not answered

Marked out of 1.00

In utility theory, what is a utility function used to represent?

- a. Satisfaction or preferences of an individual
- b. Probability distribution
- c. Cost function
- d. Loss function

The correct answer is: Satisfaction or preferences of an individual

Question **9**

Not answered

Marked out of 1.00

Which algorithm is commonly used to solve finite-horizon MDPs with a known horizon?

- a. Deep Neural Networks
- b. Monte Carlo Simulation
- c. Q-Learning
- d. Value Iteration

The correct answer is: Value Iteration

Question **10**

Not answered

Marked out of 1.00

Which axiom states that a rational decision-maker's preferences are complete and can be ranked?

- a. Axiom of Transitivity
- b. Axiom of Independence
- c. Axiom of Continuity
- d. Axiom of Completeness

The correct answer is: Axiom of Completeness

Question **11**

Not answered

Marked out of 1.00

What is the discount factor in MDPs used for?

- a. Adjusting the magnitude of rewards
- b. Defining the optimal policy
- c. Controlling the randomness of the environment
- d. Balancing the trade-off between immediate and future rewards

The correct answer is: Balancing the trade-off between immediate and future rewards

Question **12**

Not answered

Marked out of 1.00

In a Decision Network, what is the purpose of a Value Node?

- a. Quantifying utility values
- b. Representing decisions
- c. Capturing conditional probabilities
- d. Calculating risks

The correct answer is: Quantifying utility values

Question **13**

Not answered

Marked out of 1.00

What is the Bellman equation used for in the context of MDPs?

- a. Initializing the Q-values
- b. Computing the optimal policy
- c. Evaluating the transition probabilities
- d. Defining the state space

The correct answer is: Computing the optimal policy

Question **14**

Not answered

Marked out of 1.00

In MDPs, what does the term "policy" refer to?

- a. A sequence of actions
- b. The initial state of the system
- c. The set of all possible states
- d. The probability distribution over actions in each state

The correct answer is: The probability distribution over actions in each state

Question **15**

Not answered

Marked out of 1.00

How does Multiattribute Utility Analysis handle trade-offs between conflicting attributes?

- a. It prioritizes costs over benefits
- b. It allows decision-makers to assign weights to express preferences
- c. It ignores conflicting attributes
- d. It eliminates conflicting attributes from consideration

The correct answer is: It allows decision-makers to assign weights to express preferences

Question **16**

Not answered

Marked out of 1.00

What does a higher value of utility imply in the context of a utility function?

- a. Higher costs
- b. Higher risks
- c. Lower satisfaction
- d. Higher satisfaction or well-being

The correct answer is: Higher satisfaction or well-being

Question **17**

Not answered

Marked out of 1.00

What is the Bellman equation used for in the context of MDPs?

- a. Computing the optimal policy
- b. Evaluating the transition probabilities
- c. Initializing the Q-values
- d. Defining the state space

The correct answer is: Computing the optimal policy

Question **18**

Not answered

Marked out of 1.00

The Axiom of Irrelevance suggests that preferences should not be affected by:

- a. Monotonicity
- b. The order of presentation
- c. Indifference
- d. Continuity

The correct answer is: The order of presentation

Question **19**

Not answered

Marked out of 1.00

Which of the following is an example of a cooperative game?

- a. Prisoner's Dilemma
- b. Poker
- c. Coalition formation game
- d. Chess

The correct answer is: Coalition formation game

Question **20**

Not answered

Marked out of 1.00

In an MDP, what does the term "Markov" refer to?

- a. Deterministic outcomes
- b. Independence of past events
- c. Randomness
- d. Sequential decision-making

The correct answer is: Independence of past events

Unit 3 :Part -BC ►

Started on	Saturday, 23 November 2024, 8:43 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:44 AM
Time taken	11 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In MDPs, what does the term "policy" refer to?

- a. The probability distribution over actions in each state
- b. The set of all possible states
- c. A sequence of actions
- d. The initial state of the system

The correct answer is: The probability distribution over actions in each state

Question **2**

Not answered

Marked out of 1.00

The Axiom of Monotonicity states that if more of a good is preferred to less, then:

- a. Less of a good must be preferred to more
- b. A linear combination is preferred
- c. The individual is irrational
- d. More of a good must be preferred to less

The correct answer is: More of a good must be preferred to less

Question **3**

Not answered

Marked out of 1.00

Which mathematical concept is often used to model utility functions in decision theory?

- a. Linear equations
- b. Exponential functions
- c. Indifference curves
- d. Quadratic functions

The correct answer is: Indifference curves

Question **4**

Not answered

Marked out of 1.00

What role do weights play in Multiattribute Utility Functions?

- a. They represent preferences for each attribute
- b. They determine the overall cost
- c. They are used for risk minimization
- d. They are irrelevant in MAUFs

The correct answer is: They represent preferences for each attribute

Question **5**

Not answered

Marked out of 1.00

The Axiom of Transitivity implies that if an individual prefers option A to B and option B to C, then:

- a. They must prefer A to C
- b. They must prefer C to A
- c. They are indifferent between A and C
- d. They are indifferent between A, B, and C

The correct answer is: They must prefer A to C

Question **6**

Not answered

Marked out of 1.00

What is the key advantage of using Decision Networks in complex decision-making scenarios?

- a. Limited ability to represent uncertainty
- b. Exclusively focusing on individual decisions
- c. Simplicity and ease of implementation
- d. Capability to model and analyze complex decision structures

The correct answer is: Capability to model and analyze complex decision structures

Question **7**

Not answered

Marked out of 1.00

What is utility theory primarily concerned with in decision-making?

- a. Maximizing satisfaction or well-being
- b. Minimizing risks
- c. Minimizing costs
- d. Maximizing profits

The correct answer is: Maximizing satisfaction or well-being

Question **8**

Not answered

Marked out of 1.00

What is the term for the process of computing the probability of an event given the evidence in a Decision Network?

- a. Utility calculation
- b. Probability propagation
- c. Decision analysis
- d. Decision modeling

The correct answer is: Probability propagation

Question **9**

Not answered

Marked out of 1.00

In a Decision Network, what is the purpose of a Value Node?

- a. Capturing conditional probabilities
- b. Representing decisions
- c. Quantifying utility values
- d. Calculating risks

The correct answer is: Quantifying utility values

Question **10**

Not answered

Marked out of 1.00

How are relationships between nodes typically represented in a Decision Network?

- a. Through directed edges or arrows
- b. Through undirected edges
- c. Through decision trees
- d. Through probability tables

The correct answer is: Through directed edges or arrows

Question **11**

Not answered

Marked out of 1.00

What is the exploration-exploitation trade-off in the context of MDPs?

- a. Striking a balance between exploring new actions and exploiting known actions
- b. Choosing between random and deterministic actions
- c. Managing the trade-off between immediate and future rewards
- d. Balancing between state and action spaces

The correct answer is: Striking a balance between exploring new actions and exploiting known actions

Question **12**

Not answered

Marked out of 1.00

In the context of Value of Information, what does "Information Asymmetry" refer to?

- a. The exclusion of decision-makers from the information-sharing process
- b. The irrelevance of information in decision-making
- c. The unequal distribution of information among decision-makers
- d. The equal distribution of information among decision-makers

The correct answer is: The unequal distribution of information among decision-makers

Question **13**

Not answered

Marked out of 1.00

In non-cooperative games, what is the concept of dominant strategy?

- a. A strategy that is always optimal, regardless of opponents' choices
- b. A strategy that minimizes the risk of loss
- c. A strategy that maximizes the total payoff for all players
- d. A strategy that requires cooperation with other players

The correct answer is: A strategy that is always optimal, regardless of opponents' choices

Question **14**

Not answered

Marked out of 1.00

What is the key consideration in determining the Value of Information in decision-making?

- a. The impact of information on decision uncertainty
- b. The source of information
- c. The quantity of information available
- d. The cost of information acquisition

The correct answer is: The cost of information acquisition

Question **15**

Not answered

Marked out of 1.00

What is the objective of solving an MDP?

- a. Finding the optimal policy to maximize cumulative rewards
- b. Minimizing the number of actions
- c. Achieving deterministic outcomes
- d. Maximizing the number of states

The correct answer is: Finding the optimal policy to maximize cumulative rewards

Question **16**

Not answered

Marked out of 1.00

The Axiom of Irrelevance suggests that preferences should not be affected by:

- a. Indifference
- b. The order of presentation
- c. Monotonicity
- d. Continuity

The correct answer is: The order of presentation

Question **17**

Not answered

Marked out of 1.00

According to the Axiom of Non-satiation, individuals prefer:

- a. More of a good to less
- b. Higher costs
- c. Indifference
- d. Lower satisfaction

The correct answer is: More of a good to less

Question **18**

Not answered

Marked out of 1.00

In MDPs, what does the term "policy" refer to?

- a. The initial state of the system
- b. A sequence of actions
- c. The set of all possible states
- d. The probability distribution over actions in each state

The correct answer is: The probability distribution over actions in each state

Question **19**

Not answered

Marked out of 1.00

What is the discount factor in MDPs used for?

- a. Controlling the randomness of the environment
- b. Defining the optimal policy
- c. Balancing the trade-off between immediate and future rewards
- d. Adjusting the magnitude of rewards

The correct answer is: Balancing the trade-off between immediate and future rewards

Question **20**

Not answered

Marked out of 1.00

In cooperative games, what is the core of a game?

- a. The set of Nash equilibria
- b. The set of all possible strategies
- c. The set of stable payoff allocations that no subgroup can improve upon
- d. The set of dominant strategies

The correct answer is: The set of stable payoff allocations that no subgroup can improve upon

Unit 3 :Part -BC ►

Started on	Saturday, 23 November 2024, 8:44 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:44 AM
Time taken	10 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the primary purpose of Decision Networks in artificial intelligence and decision analysis?

- a. Image processing
- b. Representing and solving decision problems
- c. Speech recognition
- d. Game playing

The correct answer is: Representing and solving decision problems

Question **2**

Not answered

Marked out of 1.00

What does MDP stand for in the context of Artificial Intelligence?

- a. Machine Decision Process
- b. Model Decision Protocol
- c. Markov Decision Process
- d. Memory Decision Principle

The correct answer is: Markov Decision Process

Question **3**

Not answered

Marked out of 1.00

In decision analysis, what does the term "Irrelevance of Information" imply?

- a. Information is always irrelevant in decision-making
- b. Information is only relevant if it is costly to obtain
- c. Decision-makers should ignore all available information
- d. Additional information cannot change the decision

The correct answer is: Additional information cannot change the decision

Question **4**

Not answered

Marked out of 1.00

In Multiattribute Utility Functions, how are the individual utility functions for different attributes combined?

- a. Multiplying
- b. Summing
- c. Averaging
- d. Ignoring

The correct answer is: Summing

Question **5**

Not answered

Marked out of 1.00

The Axiom of Independence suggests that preferences should not be influenced by:

- a. Transitivity
- b. Continuity
- c. Irrelevant alternatives
- d. Completeness

The correct answer is: Irrelevant alternatives

Question **6**

Not answered

Marked out of 1.00

What is the primary purpose of using Multiattribute Utility Functions (MAUFs) in decision-making?

- a. Maximizing costs
- b. Minimizing risks
- c. Incorporating preferences over multiple attributes
- d. Ignoring preferences

The correct answer is: Incorporating preferences over multiple attributes

Question **7**

Not answered

Marked out of 1.00

In a Decision Network, what is represented by a Decision Node?

- a. Utility values
- b. Probabilities
- c. Uncertain events
- d. Decisions that can be made

The correct answer is: Decisions that can be made

Question **8**

Not answered

Marked out of 1.00

Which mathematical concept is often used to model utility functions in decision theory?

- a. Linear equations
- b. Exponential functions
- c. Indifference curves
- d. Quadratic functions

The correct answer is: Indifference curves

Question **9**

Not answered

Marked out of 1.00

How does Multiattribute Utility Analysis handle trade-offs between conflicting attributes?

- a. It ignores conflicting attributes
- b. It prioritizes costs over benefits
- c. It eliminates conflicting attributes from consideration
- d. It allows decision-makers to assign weights to express preferences

The correct answer is: It allows decision-makers to assign weights to express preferences

Question **10**

Not answered

Marked out of 1.00

How does a rational decision-maker choose between two options based on utility theory?

- a. By selecting the option with the highest cost
- b. By selecting the option with the lowest risk
- c. By ignoring preferences and choosing randomly
- d. By comparing the utilities of each option and choosing the one with higher utility

The correct answer is: By comparing the utilities of each option and choosing the one with higher utility

Question **11**

Not answered

Marked out of 1.00

The Axiom of Convexity asserts that if an individual is indifferent between two options, then they should also be indifferent between:

- a. Any non-linear combination of the two options
- b. Any linear combination of the two options
- c. Any concave combination of the two options
- d. Any convex combination of the two options

The correct answer is: Any convex combination of the two options

Question **12**

Not answered

Marked out of 1.00

What is the main characteristic of cooperative games in AI?

- a. Players follow a predetermined strategy
- b. Players collaborate to achieve common goals
- c. Players act independently
- d. Players compete without communication

The correct answer is: Players collaborate to achieve common goals

Question **13**

Not answered

Marked out of 1.00

In an MDP, what does the term "Markov" refer to?

- a. Randomness
- b. Independence of past events
- c. Deterministic outcomes
- d. Sequential decision-making

The correct answer is: Independence of past events

Question **14**

Not answered

Marked out of 1.00

How does a Decision Network handle the concept of conditional probability?

- a. Through the use of decision nodes
- b. By relying solely on utility nodes
- c. Through chance nodes and probability tables
- d. By excluding uncertain events

The correct answer is: Through chance nodes and probability tables

Question **15**

Not answered

Marked out of 1.00

What are the three main components of an MDP?

- a. States, Observations, Transitions
- b. Actions, Rewards, Observations
- c. States, Actions, Rewards
- d. Transitions, States, Rewards

The correct answer is: States, Actions, Rewards

Question **16**

Not answered

Marked out of 1.00

In MDPs, what is the purpose of the transition model?

- a. Specifies the rewards associated with each state-action pair
- b. Defines the possible states of the system
- c. Describes the probability of moving from one state to another
- d. Determines the available actions in each state

The correct answer is: Describes the probability of moving from one state to another

Question **17**

Not answered

Marked out of 1.00

Which axiom states that a rational decision-maker's preferences are complete and can be ranked?

- a. Axiom of Completeness
- b. Axiom of Independence
- c. Axiom of Continuity
- d. Axiom of Transitivity

The correct answer is: Axiom of Completeness

Question **18**

Not answered

Marked out of 1.00

Which axiom states that if an individual is indifferent between options A and B, and also indifferent between B and C, then they should be indifferent between A and C?

- a. Axiom of Transitivity
- b. Axiom of Continuity
- c. Axiom of Completeness
- d. Axiom of Independence

The correct answer is: Axiom of Transitivity

Question **19**

Not answered

Marked out of 1.00

How is the Value of Perfect Information (VPI) calculated?

- a. By ignoring the impact of perfect information on decision-making
- b. By subtracting the expected utility with perfect information from the expected utility without information
- c. By multiplying the probability of making a correct decision by the cost of information
- d. By dividing the expected utility with perfect information by the expected utility without information

The correct answer is: By subtracting the expected utility with perfect information from the expected utility without information

Question **20**

Not answered

Marked out of 1.00

What does the term "Value of Information" refer to in decision theory?

- a. The benefit of obtaining additional information before making a decision
- b. The monetary value associated with uncertain outcomes
- c. The cost of acquiring information
- d. The usefulness of already available information

The correct answer is: The benefit of obtaining additional information before making a decision

Started on	Saturday, 23 November 2024, 8:44 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:45 AM
Time taken	11 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the discount factor in MDPs used for?

- a. Balancing the trade-off between immediate and future rewards
- b. Adjusting the magnitude of rewards
- c. Defining the optimal policy
- d. Controlling the randomness of the environment

The correct answer is: Balancing the trade-off between immediate and future rewards

Question **2**

Not answered

Marked out of 1.00

In utility theory, what does the term "risk aversion" refer to?

- a. Preferring riskier options
- b. Ignoring risks
- c. Maximizing profits
- d. Preferring certain outcomes over risky ones

The correct answer is: Preferring certain outcomes over risky ones

Question **3**

Not answered

Marked out of 1.00

In MDPs, what does the term "policy" refer to?

- a. The set of all possible states
- b. The initial state of the system
- c. A sequence of actions
- d. The probability distribution over actions in each state

The correct answer is: The probability distribution over actions in each state

Question **4**

Not answered

Marked out of 1.00

In an MDP, what does the term "Markov" refer to?

- a. Randomness
- b. Deterministic outcomes
- c. Independence of past events
- d. Sequential decision-making

The correct answer is: Independence of past events

Question **5**

Not answered

Marked out of 1.00

What role do weights play in Multiattribute Utility Functions?

- a. They are irrelevant in MAUFs
- b. They determine the overall cost
- c. They are used for risk minimization
- d. They represent preferences for each attribute

The correct answer is: They represent preferences for each attribute

Question **6**

Not answered

Marked out of 1.00

What type of nodes in a Decision Network represent events with known probabilities?

- a. Utility Nodes
- b. Decision Nodes
- c. Information Nodes
- d. Chance Nodes

The correct answer is: Chance Nodes

Question **7**

Not answered

Marked out of 1.00

In Decision Networks, what is the primary function of a Chance Node?

- a. Representing decisions
- b. Quantifying utility values
- c. Calculating probabilities
- d. Representing events with uncertain outcomes

The correct answer is: Representing events with uncertain outcomes

Question **8**

Not answered

Marked out of 1.00

The Axiom of Monotonicity states that if more of a good is preferred to less, then:

- a. Less of a good must be preferred to more
- b. The individual is irrational
- c. A linear combination is preferred
- d. More of a good must be preferred to less

The correct answer is: More of a good must be preferred to less

Question **9**

Not answered

Marked out of 1.00

What is the primary purpose of using a utility function in decision-making?

- a. Representing preferences and evaluating choices
- b. Maximizing profits
- c. Maximizing risks
- d. Minimizing costs

The correct answer is: Representing preferences and evaluating choices

Question **10**

Not answered

Marked out of 1.00

Which algorithm is commonly used to solve finite-horizon MDPs with a known horizon?

- a. Deep Neural Networks
- b. Q-Learning
- c. Monte Carlo Simulation
- d. Value Iteration

The correct answer is: Value Iteration

Question **11**

Not answered

Marked out of 1.00

What does MDP stand for in the context of Artificial Intelligence?

- a. Model Decision Protocol
- b. Memory Decision Principle
- c. Markov Decision Process
- d. Machine Decision Process

The correct answer is: Markov Decision Process

Question **12**

Not answered

Marked out of 1.00

What does a higher value of utility imply in the context of a utility function?

- a. Lower satisfaction
- b. Higher satisfaction or well-being
- c. Higher risks
- d. Higher costs

The correct answer is: Higher satisfaction or well-being

Question **13**

Not answered

Marked out of 1.00

What is the Nash equilibrium in non-cooperative game theory?

- a. A strategy that guarantees a player the highest payoff regardless of others' choices
- b. A strategy profile where no player has an incentive to deviate unilaterally
- c. A situation where players take turns making decisions
- d. A situation where all players cooperate for mutual benefit

The correct answer is: A strategy profile where no player has an incentive to deviate unilaterally

Question **14**

Not answered

Marked out of 1.00

Which axiom asserts that preferences should be consistent across different scenarios or contexts?

- a. Axiom of Independence
- b. Axiom of Continuity
- c. Axiom of Irrelevance
- d. Axiom of Consistency

The correct answer is: Axiom of Consistency

Question **15**

Not answered

Marked out of 1.00

What is the primary purpose of Utility Nodes in a Decision Network?

- a. To represent uncertain events
- b. To represent decisions
- c. To calculate probabilities
- d. To quantify the desirability of different outcomes

The correct answer is: To quantify the desirability of different outcomes

Question **16**

Not answered

Marked out of 1.00

What is the main feature of non-cooperative games in AI?

- a. Players collaborate to achieve common goals
- b. Players have complete information about each other's strategies
- c. Players always follow a central authority's decisions
- d. Players act independently and pursue individual interests

The correct answer is: Players act independently and pursue individual interests

Question **17**

Not answered

Marked out of 1.00

What is the exploration-exploitation trade-off in the context of MDPs?

- a. Balancing between state and action spaces
- b. Choosing between random and deterministic actions
- c. Managing the trade-off between immediate and future rewards
- d. Striking a balance between exploring new actions and exploiting known actions

The correct answer is: Striking a balance between exploring new actions and exploiting known actions

Question **18**

Not answered

Marked out of 1.00

What are the three main components of an MDP?

- a. States, Observations, Transitions
- b. Actions, Rewards, Observations
- c. Transitions, States, Rewards
- d. States, Actions, Rewards

The correct answer is: States, Actions, Rewards

Question **19**

Not answered

Marked out of 1.00

Which of the following statements best describes the concept of diminishing marginal utility?

- a. Marginal utility remains constant
- b. Utility is independent of quantity
- c. Additional units provide decreasing additional satisfaction
- d. Marginal utility increases with quantity

The correct answer is: Additional units provide decreasing additional satisfaction

Question **20**

Not answered

Marked out of 1.00

In Multiattribute Utility Functions, what does the term "dominance" refer to?

- a. The dominance of one attribute over another
- b. The dominance of preferences over risks
- c. The dominance of costs over benefits
- d. The dominance of one alternative over another in terms of overall utility

The correct answer is: The dominance of one alternative over another in terms of overall utility

Unit 3 :Part -BC ►

Started on	Saturday, 23 November 2024, 8:45 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:45 AM
Time taken	10 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In utility theory, what is a utility function used to represent?

- a. Loss function
- b. Cost function
- c. Satisfaction or preferences of an individual
- d. Probability distribution

The correct answer is: Satisfaction or preferences of an individual

Question **2**

Not answered

Marked out of 1.00

How is utility typically measured in utility theory?

- a. In dollars
- b. In units of satisfaction or happiness
- c. In percentages
- d. In terms of risks

The correct answer is: In units of satisfaction or happiness

Question **3**

Not answered

Marked out of 1.00

The Axiom of Transitivity implies that if an individual prefers option A to B and option B to C, then:

- a. They are indifferent between A, B, and C
- b. They must prefer C to A
- c. They must prefer A to C
- d. They are indifferent between A and C

The correct answer is: They must prefer A to C

Question **4**

Not answered

Marked out of 1.00

What does the Axiom of Continuity state about preferences?

- a. Preferences are complete and transitive
- b. Preferences are independent of irrelevant alternatives
- c. Preferences are indifferent
- d. Preferences are continuous and smooth

The correct answer is: Preferences are continuous and smooth

Question **5**

Not answered

Marked out of 1.00

What is the key assumption about individuals in utility theory?

- a. Preferences of individuals are irrelevant
- b. Individuals always make irrational decisions
- c. Individuals always maximize profits
- d. Individuals have consistent and transitive preferences

The correct answer is: Individuals have consistent and transitive preferences

Question **6**

Not answered

Marked out of 1.00

What is the Bellman equation used for in the context of MDPs?

- a. Computing the optimal policy
- b. Initializing the Q-values
- c. Evaluating the transition probabilities
- d. Defining the state space

The correct answer is: Computing the optimal policy

Question **7**

Not answered

Marked out of 1.00

What is the key advantage of using Decision Networks in complex decision-making scenarios?

- a. Capability to model and analyze complex decision structures
- b. Simplicity and ease of implementation
- c. Exclusively focusing on individual decisions
- d. Limited ability to represent uncertainty

The correct answer is: Capability to model and analyze complex decision structures

Question **8**

Not answered

Marked out of 1.00

In MDPs, what is the purpose of the transition model?

- a. Determines the available actions in each state
- b. Describes the probability of moving from one state to another
- c. Defines the possible states of the system
- d. Specifies the rewards associated with each state-action pair

The correct answer is: Describes the probability of moving from one state to another

Question **9**

Not answered

Marked out of 1.00

What is the Bellman equation used for in the context of MDPs?

- a. Computing the optimal policy
- b. Evaluating the transition probabilities
- c. Defining the state space
- d. Initializing the Q-values

The correct answer is: Computing the optimal policy

Question **10**

Not answered

Marked out of 1.00

What is the objective of solving an MDP?

- a. Maximizing the number of states
- b. Finding the optimal policy to maximize cumulative rewards
- c. Minimizing the number of actions
- d. Achieving deterministic outcomes

The correct answer is: Finding the optimal policy to maximize cumulative rewards

Question **11**

Not answered

Marked out of 1.00

Which of the following is an example of a cooperative game?

- a. Coalition formation game
- b. Chess
- c. Poker
- d. Prisoner's Dilemma

The correct answer is: Coalition formation game

Question **12**

Not answered

Marked out of 1.00

Which algorithm is commonly used to solve finite-horizon MDPs with a known horizon?

- a. Q-Learning
- b. Value Iteration
- c. Deep Neural Networks
- d. Monte Carlo Simulation

The correct answer is: Value Iteration

Question **13**

Not answered

Marked out of 1.00

What is the exploration-exploitation trade-off in the context of MDPs?

- a. Managing the trade-off between immediate and future rewards
- b. Striking a balance between exploring new actions and exploiting known actions
- c. Choosing between random and deterministic actions
- d. Balancing between state and action spaces

The correct answer is: Striking a balance between exploring new actions and exploiting known actions

Question **14**

Not answered

Marked out of 1.00

Which axiom states that if an individual is indifferent between options A and B, and also indifferent between B and C, then they should be indifferent between A and C?

- a. Axiom of Transitivity
- b. Axiom of Completeness
- c. Axiom of Continuity
- d. Axiom of Independence

The correct answer is: Axiom of Transitivity

Question **15**

Not answered

Marked out of 1.00

What is the main characteristic of cooperative games in AI?

- a. Players compete without communication
- b. Players act independently
- c. Players follow a predetermined strategy
- d. Players collaborate to achieve common goals

The correct answer is: Players collaborate to achieve common goals

Question **16**

Not answered

Marked out of 1.00

According to the Axiom of Non-satiation, individuals prefer:

- a. Higher costs
- b. More of a good to less
- c. Lower satisfaction
- d. Indifference

The correct answer is: More of a good to less

Question **17**

Not answered

Marked out of 1.00

What does MDP stand for in the context of Artificial Intelligence?

- a. Model Decision Protocol
- b. Markov Decision Process
- c. Machine Decision Process
- d. Memory Decision Principle

The correct answer is: Markov Decision Process

Question **18**

Not answered

Marked out of 1.00

What are the three main components of an MDP?

- a. States, Observations, Transitions
- b. States, Actions, Rewards
- c. Transitions, States, Rewards
- d. Actions, Rewards, Observations

The correct answer is: States, Actions, Rewards

Question **19**

Not answered

Marked out of 1.00

How is the Value of Perfect Information (VPI) calculated?

- a. By dividing the expected utility with perfect information by the expected utility without information
- b. By subtracting the expected utility with perfect information from the expected utility without information
- c. By multiplying the probability of making a correct decision by the cost of information
- d. By ignoring the impact of perfect information on decision-making

The correct answer is: By subtracting the expected utility with perfect information from the expected utility without information

Question **20**

Not answered

Marked out of 1.00

What does a higher value of utility imply in the context of a utility function?

- a. Lower satisfaction
- b. Higher satisfaction or well-being
- c. Higher risks
- d. Higher costs

The correct answer is: Higher satisfaction or well-being

State	Finished
Completed on	Saturday, 23 November 2024, 8:45 AM
Time taken	10 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In MDPs, what is the purpose of the transition model?

- a. Describes the probability of moving from one state to another
- b. Defines the possible states of the system
- c. Determines the available actions in each state
- d. Specifies the rewards associated with each state-action pair

The correct answer is: Describes the probability of moving from one state to another

Question **2**

Not answered

Marked out of 1.00

In MDPs, what does the term "policy" refer to?

- a. The initial state of the system
- b. The set of all possible states
- c. The probability distribution over actions in each state
- d. A sequence of actions

The correct answer is: The probability distribution over actions in each state

Question **3**

Not answered

Marked out of 1.00

In cooperative games, what is the core of a game?

- a. The set of stable payoff allocations that no subgroup can improve upon
- b. The set of all possible strategies
- c. The set of dominant strategies
- d. The set of Nash equilibria

The correct answer is: The set of stable payoff allocations that no subgroup can improve upon

Question **4**

Not answered

Marked out of 1.00

What is utility theory primarily concerned with in decision-making?

- a. Maximizing profits
- b. Minimizing risks
- c. Maximizing satisfaction or well-being
- d. Minimizing costs

The correct answer is: Maximizing satisfaction or well-being

Question **5**

Not answered

Marked out of 1.00

What role do weights play in Multiattribute Utility Functions?

- a. They determine the overall cost
- b. They are irrelevant in MAUFs
- c. They are used for risk minimization
- d. They represent preferences for each attribute

The correct answer is: They represent preferences for each attribute

Question **6**

Not answered

Marked out of 1.00

How does a Decision Network handle the concept of conditional probability?

- a. By relying solely on utility nodes
- b. Through the use of decision nodes
- c. Through chance nodes and probability tables
- d. By excluding uncertain events

The correct answer is: Through chance nodes and probability tables

Question **7**

Not answered

Marked out of 1.00

How is utility typically measured in utility theory?

- a. In units of satisfaction or happiness
- b. In dollars
- c. In percentages
- d. In terms of risks

The correct answer is: In units of satisfaction or happiness

Question **8**

Not answered

Marked out of 1.00

What is the objective of solving an MDP?

- a. Maximizing the number of states
- b. Achieving deterministic outcomes
- c. Finding the optimal policy to maximize cumulative rewards
- d. Minimizing the number of actions

The correct answer is: Finding the optimal policy to maximize cumulative rewards

Question **9**

Not answered

Marked out of 1.00

In Multiattribute Utility Functions, what does the term "dominance" refer to?

- a. The dominance of costs over benefits
- b. The dominance of preferences over risks
- c. The dominance of one attribute over another
- d. The dominance of one alternative over another in terms of overall utility

The correct answer is: The dominance of one alternative over another in terms of overall utility

Question **10**

Not answered

Marked out of 1.00

What is the key advantage of using Decision Networks in complex decision-making scenarios?

- a. Simplicity and ease of implementation
- b. Capability to model and analyze complex decision structures
- c. Limited ability to represent uncertainty
- d. Exclusively focusing on individual decisions

The correct answer is: Capability to model and analyze complex decision structures

Question **11**

Not answered

Marked out of 1.00

What is the objective of solving an MDP?

- a. Maximizing the number of states
- b. Achieving deterministic outcomes
- c. Minimizing the number of actions
- d. Finding the optimal policy to maximize cumulative rewards

The correct answer is: Finding the optimal policy to maximize cumulative rewards

Question **12**

Not answered

Marked out of 1.00

In non-cooperative games, what is the concept of dominant strategy?

- a. A strategy that maximizes the total payoff for all players
- b. A strategy that requires cooperation with other players
- c. A strategy that minimizes the risk of loss
- d. A strategy that is always optimal, regardless of opponents' choices

The correct answer is: A strategy that is always optimal, regardless of opponents' choices

Question **13**

Not answered

Marked out of 1.00

In utility theory, what does the term "risk aversion" refer to?

- a. Maximizing profits
- b. Preferring riskier options
- c. Preferring certain outcomes over risky ones
- d. Ignoring risks

The correct answer is: Preferring certain outcomes over risky ones

Question **14**

Not answered

Marked out of 1.00

What are the three main components of an MDP?

- a. States, Observations, Transitions
- b. Transitions, States, Rewards
- c. Actions, Rewards, Observations
- d. States, Actions, Rewards

The correct answer is: States, Actions, Rewards

Question **15**

Not answered

Marked out of 1.00

What is the discount factor in MDPs used for?

- a. Adjusting the magnitude of rewards
- b. Balancing the trade-off between immediate and future rewards
- c. Defining the optimal policy
- d. Controlling the randomness of the environment

The correct answer is: Balancing the trade-off between immediate and future rewards

Question **16**

Not answered

Marked out of 1.00

What is the term for the process of computing the probability of an event given the evidence in a Decision Network?

- a. Decision analysis
- b. Probability propagation
- c. Decision modeling
- d. Utility calculation

The correct answer is: Probability propagation

Question **17**

Not answered

Marked out of 1.00

What does the term "Value of Information" refer to in decision theory?

- a. The benefit of obtaining additional information before making a decision
- b. The usefulness of already available information
- c. The monetary value associated with uncertain outcomes
- d. The cost of acquiring information

The correct answer is: The benefit of obtaining additional information before making a decision

Question **18**

Not answered

Marked out of 1.00

Which axiom states that a rational decision-maker's preferences are complete and can be ranked?

- a. Axiom of Completeness
- b. Axiom of Transitivity
- c. Axiom of Continuity
- d. Axiom of Independence

The correct answer is: Axiom of Completeness

Question **19**

Not answered

Marked out of 1.00

The Axiom of Monotonicity states that if more of a good is preferred to less, then:

- a. A linear combination is preferred
- b. More of a good must be preferred to less
- c. The individual is irrational
- d. Less of a good must be preferred to more

The correct answer is: More of a good must be preferred to less

Question **20**

Not answered

Marked out of 1.00

In the context of Value of Information, what does "Information Asymmetry" refer to?

- a. The exclusion of decision-makers from the information-sharing process
- b. The unequal distribution of information among decision-makers
- c. The equal distribution of information among decision-makers
- d. The irrelevance of information in decision-making

The correct answer is: The unequal distribution of information among decision-makers

Question **1**

Not answered

Marked out of 1.00

What is the Bellman equation used for in the context of MDPs?

- a. Computing the optimal policy
- b. Evaluating the transition probabilities
- c. Initializing the Q-values
- d. Defining the state space

The correct answer is: Computing the optimal policy

Question **2**

Not answered

Marked out of 1.00

What type of nodes in a Decision Network represent events with known probabilities?

- a. Decision Nodes
- b. Information Nodes
- c. Chance Nodes
- d. Utility Nodes

The correct answer is: Chance Nodes

Question **3**

Not answered

Marked out of 1.00

What is the main feature of non-cooperative games in AI?

- a. Players act independently and pursue individual interests
- b. Players collaborate to achieve common goals
- c. Players always follow a central authority's decisions
- d. Players have complete information about each other's strategies

The correct answer is: Players act independently and pursue individual interests

Question **4**

Not answered

Marked out of 1.00

How are relationships between nodes typically represented in a Decision Network?

- a. Through probability tables
- b. Through decision trees
- c. Through undirected edges
- d. Through directed edges or arrows

The correct answer is: Through directed edges or arrows

Question **5**

Not answered

Marked out of 1.00

Which axiom asserts that preferences should be consistent across different scenarios or contexts?

- a. Axiom of Independence
- b. Axiom of Irrelevance
- c. Axiom of Consistency
- d. Axiom of Continuity

The correct answer is: Axiom of Consistency

Question **6**

Not answered

Marked out of 1.00

Which algorithm is commonly used to solve finite-horizon MDPs with a known horizon?

- a. Monte Carlo Simulation
- b. Deep Neural Networks
- c. Q-Learning
- d. Value Iteration

The correct answer is: Value Iteration

Question **7**

Not answered

Marked out of 1.00

Which of the following statements best describes the concept of diminishing marginal utility?

- a. Additional units provide decreasing additional satisfaction
- b. Marginal utility remains constant
- c. Marginal utility increases with quantity
- d. Utility is independent of quantity

The correct answer is: Additional units provide decreasing additional satisfaction

Question **8**

Not answered

Marked out of 1.00

In Decision Networks, what is the primary function of a Chance Node?

- a. Calculating probabilities
- b. Quantifying utility values
- c. Representing decisions
- d. Representing events with uncertain outcomes

The correct answer is: Representing events with uncertain outcomes

Question **9**

Not answered

Marked out of 1.00

What does MDP stand for in the context of Artificial Intelligence?

- a. Machine Decision Process
- b. Memory Decision Principle
- c. Model Decision Protocol
- d. Markov Decision Process

The correct answer is: Markov Decision Process

Question **10**

Not answered

Marked out of 1.00

What is the primary purpose of using Multiattribute Utility Functions (MAUFs) in decision-making?

- a. Ignoring preferences
- b. Minimizing risks
- c. Maximizing costs
- d. Incorporating preferences over multiple attributes

The correct answer is: Incorporating preferences over multiple attributes

Question **11**

Not answered

Marked out of 1.00

What is the exploration-exploitation trade-off in the context of MDPs?

- a. Balancing between state and action spaces
- b. Managing the trade-off between immediate and future rewards
- c. Striking a balance between exploring new actions and exploiting known actions
- d. Choosing between random and deterministic actions

The correct answer is: Striking a balance between exploring new actions and exploiting known actions

Question **12**

Not answered

Marked out of 1.00

In a Decision Network, what is the purpose of a Value Node?

- a. Quantifying utility values
- b. Representing decisions
- c. Capturing conditional probabilities
- d. Calculating risks

The correct answer is: Quantifying utility values

Question **13**

Not answered

Marked out of 1.00

Which of the following is an example of a cooperative game?

- a. Coalition formation game
- b. Chess
- c. Prisoner's Dilemma
- d. Poker

The correct answer is: Coalition formation game

Question **14**

Not answered

Marked out of 1.00

In decision analysis, what does the term "Irrelevance of Information" imply?

- a. Decision-makers should ignore all available information
- b. Information is only relevant if it is costly to obtain
- c. Additional information cannot change the decision
- d. Information is always irrelevant in decision-making

The correct answer is: Additional information cannot change the decision

Question **15**

Not answered

Marked out of 1.00

Which algorithm is commonly used to solve finite-horizon MDPs with a known horizon?

- a. Deep Neural Networks
- b. Q-Learning
- c. Value Iteration
- d. Monte Carlo Simulation

The correct answer is: Value Iteration

Question **16**

Not answered

Marked out of 1.00

In MDPs, what is the purpose of the transition model?

- a. Specifies the rewards associated with each state-action pair
- b. Describes the probability of moving from one state to another
- c. Defines the possible states of the system
- d. Determines the available actions in each state

The correct answer is: Describes the probability of moving from one state to another

Question **17**

Not answered

Marked out of 1.00

What is the discount factor in MDPs used for?

- a. Controlling the randomness of the environment
- b. Defining the optimal policy
- c. Balancing the trade-off between immediate and future rewards
- d. Adjusting the magnitude of rewards

The correct answer is: Balancing the trade-off between immediate and future rewards

Question **18**

Not answered

Marked out of 1.00

How does a rational decision-maker choose between two options based on utility theory?

- a. By selecting the option with the lowest risk
- b. By comparing the utilities of each option and choosing the one with higher utility
- c. By ignoring preferences and choosing randomly
- d. By selecting the option with the highest cost

The correct answer is: By comparing the utilities of each option and choosing the one with higher utility

Question **19**

Not answered

Marked out of 1.00

In a Decision Network, what is represented by a Decision Node?

- a. Utility values
- b. Probabilities
- c. Uncertain events
- d. Decisions that can be made

The correct answer is: Decisions that can be made

Question **20**

Not answered

Marked out of 1.00

The Axiom of Transitivity implies that if an individual prefers option A to B and option B to C, then:

- a. They are indifferent between A and C
- b. They must prefer A to C
- c. They must prefer C to A
- d. They are indifferent between A, B, and C

The correct answer is: They must prefer A to C

Unit 3 :Part -BC ►

Started on	Tuesday, 22 October 2024, 1:28 PM
State	Finished
Completed on	Tuesday, 22 October 2024, 1:28 PM
Time taken	9 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In TD learning, what does the term "temporal difference" refer to?

- a. The difference between predicted and actual rewards at a given time step
- b. The time it takes for an agent to make a decision
- c. The duration of an episode in a reinforcement learning task
- d. The time it takes for a neural network to converge during training

Your answer is incorrect.

The correct answer is: The difference between predicted and actual rewards at a given time step

Question **2**

Not answered

Marked out of 1.00

What role does the discount factor (γ) play in TD learning?

- a. It controls the exploration-exploitation trade-off
- b. It discounts future rewards to account for their uncertainty
- c. It adjusts the learning rate during training
- d. It determines the speed of convergence

Your answer is incorrect.

The correct answer is: It discounts future rewards to account for their uncertainty

Question **3**

Not answered

Marked out of 1.00

In Temporal Difference (TD) learning, what does the term "temporal difference" refer to?

- a. The difference between the discounted future reward and the immediate reward.
- b. The difference between the predicted and actual reward received at the same time.
- c. The difference between the reward received at two consecutive time steps.
- d. The difference between the estimated value of two consecutive states.

Your answer is incorrect.

The correct answer is: The difference between the reward received at two consecutive time steps.

Question **4**

Not answered

Marked out of 1.00

What is the role of the discount factor (γ) in TD learning?

- a. It determines the learning rate of the algorithm.
- b. It prevents the algorithm from getting stuck in cycles.
- c. It controls the trade-off between immediate and future rewards.
- d. It guarantees the convergence of the value estimates.

Your answer is incorrect.

The correct answer is: It controls the trade-off between immediate and future rewards.

Question **5**

Not answered

Marked out of 1.00

What is the purpose of the epsilon-greedy strategy in SARSA?

- a. To reduce the impact of rewards in the learning process.
- b. To punish the agent for choosing suboptimal actions.
- c. To always choose the action with the highest Q-value.
- d. To encourage exploration by choosing a random action with probability epsilon.

Your answer is incorrect.

The correct answer is: To encourage exploration by choosing a random action with probability epsilon.

Question **6**

Not answered

Marked out of 1.00

How does SARSA handle continuous action spaces in reinforcement learning?

- a. SARSA cannot be applied to continuous action spaces.
- b. SARSA is only suitable for problems with discrete state spaces.
- c. SARSA uses a different algorithm for continuous action spaces.
- d. SARSA discretizes the continuous action space.

Your answer is incorrect.

The correct answer is: SARSA discretizes the continuous action space.

Question **7**

Not answered

Marked out of 1.00

When is SARSA particularly useful in reinforcement learning tasks?

- a. In tasks where on-policy learning is essential
- b. In environments with a deterministic dynamics model
- c. In scenarios with continuous state and action spaces
- d. In episodic tasks with a fixed number of time steps

Your answer is incorrect.

The correct answer is: In tasks where on-policy learning is essential

Question **8**

Not answered

Marked out of 1.00

What are some practical applications where SARSA could be effectively employed for reinforcement learning tasks?

- a. Natural language processing and sentiment analysis.
- b. Image classification and computer vision.
- c. Game playing and robotic control.
- d. SARSA is only applicable to theoretical reinforcement learning scenarios.

Your answer is incorrect.

The correct answer is: Game playing and robotic control.

Question **9**

Not answered

Marked out of 1.00

In Q-learning, how does the exploration strategy affect the learning process?

- a. It ensures that the agent always chooses the greedy action.
- b. It balances the trade-off between exploration and exploitation.
- c. It maximizes the immediate reward in each time step.
- d. It reduces the impact of temporal difference errors.

Your answer is incorrect.

The correct answer is: It balances the trade-off between exploration and exploitation.

Question **10**

Not answered

Marked out of 1.00

What is the key difference between SARSA and Q-learning?

- a. SARSA does not use Q-values, only state-action values.
- b. SARSA updates the Q-value of the next state-action pair, while Q-learning updates the Q-value of the current state-action pair.
- c. SARSA updates the Q-value of the current state-action pair, while Q-learning updates the Q-value of the next state-action pair.
- d. Q-learning and SARSA are essentially the same algorithm with different names.

Your answer is incorrect.

The correct answer is: SARSA updates the Q-value of the current state-action pair, while Q-learning updates the Q-value of the next state-action pair.

Question **11**

Not answered

Marked out of 1.00

What is the role of the epsilon-greedy policy in Q-learning?

- a. It discounts future rewards based on the time horizon.
- b. It penalizes the agent for taking suboptimal actions.
- c. It introduces exploration by occasionally choosing random actions.
- d. It guarantees finding the optimal policy with certainty.

Your answer is incorrect.

The correct answer is: It introduces exploration by occasionally choosing random actions.

Question **12**

Not answered

Marked out of 1.00

What is the fundamental goal of Q-learning in reinforcement learning?

- a. Balancing state-action pairs for equal exploration.
- b. Learning an optimal policy to maximize cumulative rewards.
- c. Minimizing the exploration-exploitation trade-off.
- d. Prioritizing immediate rewards over long-term gains.

Your answer is incorrect.

The correct answer is: Learning an optimal policy to maximize cumulative rewards.

Question **13**

Not answered

Marked out of 1.00

What role do the SEEDS play in the provided code?

```
import random
import matplotlib
import matplotlib.pyplot as plt
import matplotlib.pylab as pylab
SEEDS = (12, 34, 56, 78, 90)
```

- a. They set the random seeds for reproducibility.
- b. They control the verbosity of warning messages.
- c. They determine the color palette for matplotlib plots.
- d. They specify the size of the tabulated data.

Your answer is incorrect.

The correct answer is: They set the random seeds for reproducibility.

Question **14**

Not answered

Marked out of 1.00

What information does the line 'Q[state][action] = Q[state][action] + alphas[e] * td_error' provide about the SARSA algorithm?

```
td_error = td_target - Q[state][action]
Q[state][action] = Q[state][action] + alphas[e] * td_error
```

- a. It calculates the optimal policy for each state.
- b. It updates the Q-value for the current state-action pair.
- c. It defines the decay schedule for the exploration parameter (epsilon).
- d. It initializes the Q-values for each state-action pair.

Your answer is incorrect.

The correct answer is: It updates the Q-value for the current state-action pair.

Question **15**

Not answered

Marked out of 1.00

In First Visit Monte Carlo, what is the primary criterion for determining whether a state has been visited for the first time in an episode?

- a. Whether the state has been encountered earlier in the episode.
- b. The cumulative rewards obtained in the state.
- c. Whether the state has the highest Q-value.
- d. The state's location in the environment.

Your answer is incorrect.

The correct answer is: Whether the state has been encountered earlier in the episode.

Question **16**

Not answered

Marked out of 1.00

How is the exploration-exploitation strategy influenced by the following line in the `sarsa` function?

```
select_action = lambda state, Q, epsilon: np.argmax(Q[state]) \
    if np.random.random() > epsilon \
    else np.random.randint(len(Q[state]))
```

- a. It gradually increases the exploration rate during training.
- b. It enforces a strict exploitation strategy throughout training.
- c. It introduces randomness by choosing a random action with probability epsilon.
- d. It ensures that the agent always selects the action with the highest Q-value.

Your answer is incorrect.

The correct answer is: It introduces randomness by choosing a random action with probability epsilon.

Question **17**

Not answered

Marked out of 1.00

What is the primary purpose of the provided Python function generate_trajectory?

```
def generate_trajectory(select_action, Q, epsilon, env, max_steps=200):
    done, trajectory = False, []
    while not done:
        state = env.reset()
        for t in count():
            action = select_action(state, Q, epsilon)
            next_state, reward, done, _ = env.step(action)
            experience = (state, action, reward, next_state, done)
            trajectory.append(experience)
```

- a. To calculate the reward for a given action in the environment
- b. To compute the optimal action at each state based on Q-values
- c. To create a random trajectory in the environment
- d. To simulate the agent's interaction with the environment and record the trajectory

Your answer is incorrect.

The correct answer is: To simulate the agent's interaction with the environment and record the trajectory

Question **18**

Not answered

Marked out of 1.00

What does the parameter max_steps represent in the context of the decay_schedule function?

- a. The maximum value of the decay schedule
- b. The minimum value the decay schedule can reach
- c. The number of steps over which the decay occurs
- d. The maximum allowable decay ratio

Your answer is incorrect.

The correct answer is: The number of steps over which the decay occurs

Question **19**

Not answered

Marked out of 1.00

What is the purpose of the condition 'if t >= max_steps - 1:' in the function 'generate_trajectory'?

```
experience = (state, action, reward, next_state, done)
trajectory.append(experience)
if done:
    break
if t >= max_steps - 1:
    trajectory = []
    break
state = next_state
```

- a. To reset the environment and generate a new trajectory
- b. To terminate the trajectory when the agent reaches the goal state
- c. To limit the number of steps in each trajectory
- d. To visualize the agent's trajectory in the environment

Your answer is incorrect.

The correct answer is: To limit the number of steps in each trajectory

Question **20**

Not answered

Marked out of 1.00

What does the term td_target represent in the context of the code?

```
td_target = reward + gamma * Q[next_state].max() * (not done)
td_error = td_target - Q[state][action]
Q[state][action] = Q[state][action] + alphas[e] * td_error
state = next_state
```

- a. It determines the target value for updating the Q-values.
- b. It is the reward obtained in the current state.
- c. It is the maximum Q-value of the next state.
- d. It calculates the temporal difference error.

Your answer is incorrect.

The correct answer is: It determines the target value for updating the Q-values.

Unit-IV Questions ►

Started on	Tuesday, 5 November 2024, 8:45 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:46 AM
Time taken	11 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What are the three types of connections between nodes in a Bayesian network?

- a. Causal, evidential, and intercausal
- b. Serial, parallel, and diverging
- c. Head-to-head, head-to-tail, and tail-to-tail
- d. Forward, backward, and bidirectional

The correct answer is: Head-to-head, head-to-tail, and tail-to-tail

Question **2**
Not answered
Marked out of 1.00

What is the conditional probability table (CPT) associated with each node in a Bayesian network?

- a. A table that specifies the probability of each possible value of the node given the values of its children
- b. A table that specifies the probability of each possible value of the node given the values of all other nodes
- c. A table that specifies the probability of each possible value of the node given the values of its parents
- d. A table that specifies the probability of each possible value of the node regardless of the values of other nodes

The correct answer is: A table that specifies the probability of each possible value of the node given the values of its parents

Question **3**
Not answered
Marked out of 1.00

What role does the "maximization" step play in the EM algorithm for density estimation?

- a. Maximizing the likelihood with respect to parameters
- b. Computing expected values
- c. Updating the observed data likelihood
- d. Estimating hidden variables

The correct answer is: Maximizing the likelihood with respect to parameters

Question **4**

Not answered

Marked out of 1.00

Which term is often associated with the latent or hidden variables in the context of the EM algorithm?

- a. E-step
- b. M-step
- c. Complete data
- d. Maximization

The correct answer is: E-step

Question **5**

Not answered

Marked out of 1.00

k-means algorithm is used when

- a. clusters are distinct
- b. clusters are obtained from real-time data
- c. clusters are overlapping
- d. clusters are globular

The correct answer is: clusters are distinct

Question **6**

Not answered

Marked out of 1.00

How does the Naive Bayes model handle new examples during the classification phase?

- a. By updating the model
- b. By calculating posterior probabilities
- c. By discarding them
- d. By using Bayesian priors only

The correct answer is: By calculating posterior probabilities

Question **7**

Not answered

Marked out of 1.00

In what cases can maximum-likelihood solutions be found easily in closed form?

- a. Clustering using mixtures of Gaussians
- b. Fully observable Bayesian networks
- c. Nonlinear regression
- d. Complex hypothesis spaces

The correct answer is: Fully observable Bayesian networks

Question **8**

Not answered

Marked out of 1.00

What is required for trading off model complexity against the degree of fit in model selection?

- a. Maximum-likelihood solutions
- b. Probabilistic inference
- c. Uniform priors
- d. Discrete search in the space of structures

The correct answer is: Discrete search in the space of structures

Question **9**

Not answered

Marked out of 1.00

What is the primary goal of nonparametric models in statistical learning?

- a. Minimizing model complexity
- b. Utilizing Bayesian inference
- c. Representing distributions using a fixed number of parameters
- d. Representing distributions using data points

The correct answer is: Representing distributions using data points

Question **10**

Not answered

Marked out of 1.00

What is the general nature of the EM algorithm's convergence in density estimation?

- a. Converges only for linear models
- b. Convergence is not relevant
- c. May converge to local optima
- d. Always converges to a global minimum

The correct answer is: May converge to local optima

Question **11**

Not answered

Marked out of 1.00

How does the EM algorithm contribute to the robustness of density estimation models?

- a. By increasing model complexity
- b. By relying on large datasets
- c. By ignoring outliers
- d. By handling incomplete data gracefully

The correct answer is: By handling incomplete data gracefully

Question **12**

Not answered

Marked out of 1.00

What does Maximum a Posteriori (MAP) learning aim to select given the data?

- a. A single most likely hypothesis
- b. The least likely hypothesis
- c. All possible hypotheses
- d. The hypothesis with minimum complexity

The correct answer is: A single most likely hypothesis

Question **13**

Not answered

Marked out of 1.00

How do kernel methods in nonparametric models combine examples for prediction?

- a. Distance-weighted combination
- b. Bayesian-weighted combination
- c. Uniformly weighted combination
- d. Maximum-likelihood combination

The correct answer is: Distance-weighted combination

Question **14**

Not answered

Marked out of 1.00

How does Bayesian learning handle predictions compared to traditional methods?

- a. By using raw data only
- b. By using weighted averages over all hypotheses
- c. By ignoring hypotheses
- d. By using a single "best" hypothesis

The correct answer is: By using weighted averages over all hypotheses

Question **15**

Not answered

Marked out of 1.00

In Bayesian statistics, what does MAP stand for?

- a. Maximum Approximation Posterior
- b. Maximum Approximation Probability
- c. Minimum A Posteriori Probability
- d. Maximum A Posteriori

The correct answer is: Maximum A Posteriori

Question **16**

Not answered

Marked out of 1.00

The main disadvantage of MLE over Bayesian Linear Regression is

- a. Overfitting
- b. Defining Probabilities
- c. Underfitting
- d. Maximizing Probability Estimates

The correct answer is: Overfitting

Question **17**

Not answered

Marked out of 1.00

What does the number of parameters in nonparametric models grow with?

- a. Number of features
- b. Collection of data points
- c. Model complexity
- d. Size of the training set

The correct answer is: Size of the training set

Question **18**

Not answered

Marked out of 1.00

What is the primary focus of learning structure in the density estimation process?

- a. Extracting features from the data
- b. Identifying the structure of the probability model
- c. Determining the numerical parameters
- d. Selecting the appropriate model

The correct answer is: Identifying the structure of the probability model

Question **19**

Not answered

Marked out of 1.00

Why does Bayesian learning become intractable for complex hypothesis spaces?

- a. Lack of mathematical underpinnings
- b. Difficulty in probabilistic inference
- c. Due to the use of uniform priors
- d. Ockham's razor is not applicable

The correct answer is: Difficulty in probabilistic inference

Question **20**

Not answered

Marked out of 1.00

What is a potential limitation of the EM algorithm in statistical learning?

- a. Independence of initial parameter values
- b. Inability to handle missing data
- c. Fast convergence in all cases
- d. Sensitivity to outliers

The correct answer is: Sensitivity to outliers

◄ Activity: Gaussian Distribution Function

Unit 4 - Part B C ►

Started on	Tuesday, 5 November 2024, 8:47 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:47 AM
Time taken	12 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What type of distributions are effectively modeled using the EM algorithm in statistical learning?

- a. Poisson distributions
- b. Uniform distributions
- c. Gaussian distributions
- d. Exponential distributions

The correct answer is: Gaussian distributions

Question **2**
Not answered
Marked out of 1.00

How does MAP learning differ from full Bayesian learning?

- a. It is often more tractable for complex spaces.
- b. It considers all possible hypotheses.
- c. It does not involve hypothesis priors.
- d. It uses a uniform prior.

The correct answer is: It does not involve hypothesis priors.

Question **3**
Not answered
Marked out of 1.00

What does the term "posterior" refer to in Bayesian statistics?

- a. Likelihood function
- b. Combined information from prior and data
- c. Conditional probability of observed data
- d. Prior probability distribution

The correct answer is: Combined information from prior and data

Question **4**

Not answered

Marked out of 1.00

What does an edge in a Bayesian network represent?

- a. A dependency
- b. A logical implication
- c. A correlation
- d. A direct influence

The correct answer is: A direct influence

Question **5**

Not answered

Marked out of 1.00

In the context of the EM algorithm, what does the term "latent variables" refer to?

- a. Parameters of the model
- b. Observed data
- c. Variables with missing data
- d. Variables not directly observed

The correct answer is: Variables not directly observed

Question **6**

Not answered

Marked out of 1.00

Which of the following scenarios is suitable for using Maximum Likelihood Estimation (MLE)?

- a. When the sample size is small
- b. When prior information is available and reliable
- c. When the likelihood function is not well-defined
- d. When the data distribution is unknown

The correct answer is: When the sample size is small

Question **7**

Not answered

Marked out of 1.00

How do nonparametric models represent a distribution in statistical learning?

- a. Using the collection of data points
- b. Using a fixed number of parameters
- c. Utilizing Bayesian priors
- d. Employing uniform priors

The correct answer is: Using the collection of data points

Question **8**

Not answered

Marked out of 1.00

In the EM algorithm, what happens during each iteration of the E-step?

- a. Parameters are updated.
- b. Model likelihood is maximized.
- c. Observed data is ignored.
- d. Expected values of hidden variables are computed.

The correct answer is: Expected values of hidden variables are computed.

Question **9**

Not answered

Marked out of 1.00

What is the advantage of using a Bayesian network over a full joint probability distribution?

- a. A Bayesian network can handle missing data and uncertainty better
- b. A Bayesian network can represent complex domains with fewer parameters
- c. All of the above
- d. A Bayesian network can perform inference and learning more efficiently

The correct answer is: A Bayesian network can represent complex domains with fewer parameters

Question **10**

Not answered

Marked out of 1.00

What is the Markov blanket of a node in a Bayesian network?

- a. The set of nodes that are reachable from the node
- b. The set of nodes that are d-separated from the node
- c. The set of nodes that are conditionally independent of the node
- d. The set of nodes that are directly connected to the node

The correct answer is: The set of nodes that are directly connected to the node

Question **11**

Not answered

Marked out of 1.00

How are maximum-likelihood parameter values estimated in the Naive Bayes model?

- a. Using gradient descent
- b. Randomly selecting values
- c. From the training data
- d. Based on Bayesian priors

The correct answer is: From the training data

Question **12**

Not answered

Marked out of 1.00

What is a particularly effective technique that scales well in simple cases like linear regression?

- a. Maximum-likelihood learning
- b. MAP learning
- c. Naive Bayes learning
- d. Nonparametric models

The correct answer is: Naive Bayes learning

Question **13**

Not answered

Marked out of 1.00

What does Ockham's razor provide a good way to implement in Bayesian learning methods?

- a. Hypothesis selection
- b. Maximum likelihood
- c. Uniform priors
- d. Minimum model complexity

The correct answer is: Minimum model complexity

Question **14**

Not answered

Marked out of 1.00

What is the primary goal of Maximum Likelihood Estimation (MLE)?

- a. Minimize the posterior probability
- b. Maximize the likelihood of observed data
- c. Maximize the number of hypotheses
- d. Minimize the prior probability

The correct answer is: Maximize the likelihood of observed data

Question **15**

Not answered

Marked out of 1.00

What does the equation P(X |d) = Σ P(X |hi)P(hi |d) represent?

- a. Probability of bag type given candy flavor
- b. Probability of candy flavor given bag type
- c. Probability of candy wrapper color given candy flavor
- d. Probability of an unknown quantity given data

The correct answer is: Probability of an unknown quantity given data

Question **16**

Not answered

Marked out of 1.00

What is a key characteristic of nonparametric models in terms of the number of parameters?

- a. It grows with the training set size.
- b. It is independent of the number of features.
- c. It remains constant regardless of the training set size.
- d. It decreases as the model complexity increases.

The correct answer is: It grows with the training set size.

Question **17**

Not answered

Marked out of 1.00

In statistical learning, what impact does increasing the number of clusters in a Gaussian Mixture Model (GMM) have?

- a. Increases model complexity
- b. Decreases model flexibility
- c. Has no effect on the model
- d. Improves convergence speed

The correct answer is: Increases model complexity

Question **18**

Not answered

Marked out of 1.00

What does a node in a Bayesian network represent?

- a. A conditional probability
- b. A causal relationship
- c. A marginal distribution
- d. A random variable

The correct answer is: A random variable

Question **19**

Not answered

Marked out of 1.00

Which formula is used to calculate the probability of each hypothesis in Bayes' rule?

- a. P(hi) = P(d|hi)P(hi |d)
- b. P(hi |d) = P(hi) / P(d|hi)
- c. P(hi |d) = P(d|hi)P(hi)
- d. P(hi) = P(hi |d) / P(d|hi)

The correct answer is: P(hi |d) = P(d|hi)P(hi)

Question **20**

Not answered

Marked out of 1.00

What is the goal of density estimation when learning a probability model with complete data?

- a. Ignoring the data distribution
- b. Finding the structure of the probability model
- c. Estimating parameters for a fixed probability model structure
- d. Learning the entire probability model

The correct answer is: Estimating parameters for a fixed probability model structure

◄ Activity: Gaussian Distribution Function

Unit 4 - Part B C ►

Started on	Tuesday, 5 November 2024, 8:47 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:47 AM
Time taken	8 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

In density estimation, what does parameter learning specifically focus on?

- a. Learning the entire probability model
- b. Finding numerical parameters for a fixed probability model structure
- c. Finding the structure of the probability model
- d. Ignoring numerical parameters and focusing on structure

The correct answer is: Finding numerical parameters for a fixed probability model structure

Question **2**
Not answered
Marked out of 1.00

What type of probability model is mentioned for learning conditional probabilities?

- a. Markov chain model
- b. Decision tree model
- c. Gaussian mixture model
- d. Bayesian network model

The correct answer is: Bayesian network model

Question **3**
Not answered
Marked out of 1.00

What determines a deterministic prediction in the Naive Bayes model?

- a. Bayesian priors
- b. Maximum-likelihood estimates
- c. Highest posterior probability
- d. Random selection

The correct answer is: Highest posterior probability

Question **4**

Not answered

Marked out of 1.00

In the EM algorithm, what does the log-likelihood function represent during the expectation step?

- a. Probability of observed data
- b. Probability of model parameters
- c. Probability of missing data
- d. Probability of hidden variables

The correct answer is: Probability of hidden variables

Question **5**

Not answered

Marked out of 1.00

What does the likelihood function represent in both MLE and MAP estimation?

- a. Measure of how well the parameters explain the observed data
- b. Posterior information
- c. The difference between prior and posterior probabilities
- d. Prior information

The correct answer is: Measure of how well the parameters explain the observed data

Question **6**

Not answered

Marked out of 1.00

In nonparametric models, how do nearest-neighbors methods make predictions?

- a. By uniformly weighting all examples
- b. By looking at the examples nearest to the point in question
- c. By employing Bayesian priors
- d. By using a fixed set of parameters

The correct answer is: By looking at the examples nearest to the point in question

Question **7**

Not answered

Marked out of 1.00

What does the probability expression P(C | x1, x2, ..., xn) represent in the Naive Bayes model?

- a. Prior probability of C
- b. Posterior probability of C
- c. Conditional probability of C
- d. Likelihood probability of C

The correct answer is: Posterior probability of C

Question **8**

Not answered

Marked out of 1.00

Which of the following statements is true regarding MAP estimation?

- a. It is equivalent to minimizing the prior probability
- b. It balances prior beliefs with observed data
- c. It accounts for uncertainties through likelihood only
- d. It always leads to the same result as MLE

The correct answer is: It balances prior beliefs with observed data

Question **9**

Not answered

Marked out of 1.00

How do Bayesian learning methods update hypotheses using observations?

- a. By minimizing model complexity
- b. Through probabilistic inference
- c. By selecting a single hypothesis
- d. By maximizing likelihood

The correct answer is: Through probabilistic inference

Question **10**

Not answered

Marked out of 1.00

What are the two components of a Bayesian network?

- a. Parameters and probabilities
- b. Queries and evidence
- c. Variables and values
- d. Nodes and edges

The correct answer is: Nodes and edges

Question **11**

Not answered

Marked out of 1.00

What does the likelihood of the data under each hypothesis, P(d|hi), signify in Bayes' rule?

- a. Measure of how well the data fits a hypothesis
- b. Probability of candy flavor given bag type
- c. Probability of bag type given data
- d. Probability of bag type given candy flavor

The correct answer is: Measure of how well the data fits a hypothesis

Question **12**

Not answered

Marked out of 1.00

Originally, density estimation was applied to probability density functions for which type of variables?

- a. Nominal variables only
- b. Discrete variables only
- c. Continuous variables only
- d. Both continuous and discrete variables

The correct answer is: Continuous variables only

Question **13**

Not answered

Marked out of 1.00

Which type of distributions can be effectively modeled using the EM algorithm in density estimation?

- a. Exponential distributions
- b. Uniform distributions
- c. Poisson distributions
- d. Gaussian distributions

The correct answer is: Gaussian distributions

Question **14**

Not answered

Marked out of 1.00

What is the primary focus of Bayesian learning methods in statistical learning?

- a. Formulating learning as probabilistic inference
- b. Selecting hypotheses based on maximum likelihood
- c. Utilizing Ockham's razor for hypothesis selection
- d. Minimizing model complexity

The correct answer is: Formulating learning as probabilistic inference

Question **15**

Not answered

Marked out of 1.00

What does MLE stand for in the context of statistical estimation?

- a. Minimum Learning Experience
- b. Maximum Learning Experience
- c. Maximum Likelihood Estimation
- d. Minimum Likelihood Estimation

The correct answer is: Maximum Likelihood Estimation

Question **16**

Not answered

Marked out of 1.00

What is the impact of increasing the number of clusters in a Gaussian Mixture Model (GMM) estimated by the EM algorithm?

- a. Decreases model flexibility
- b. Has no effect on the model
- c. Improves convergence speed
- d. Increases model complexity

The correct answer is: Increases model complexity

Question **17**

Not answered

Marked out of 1.00

What is the main challenge addressed by the EM algorithm in the context of density estimation?

- a. Handling missing data
- b. Unsupervised learning
- c. Overfitting
- d. Model selection

The correct answer is: Handling missing data

Question **18**

Not answered

Marked out of 1.00

What is the main advantage of incorporating prior information in MAP estimation?

- a. Reduced accuracy in parameter estimation
- b. Improved robustness in small sample sizes
- c. Increased computational complexity
- d. Faster convergence of algorithms

The correct answer is: Improved robustness in small sample sizes

Question **19**

Not answered

Marked out of 1.00

What happens to MAP estimation when the amount of prior information increases?

- a. MAP becomes computationally infeasible
- b. MAP estimates become more influenced by prior information
- c. MAP estimates become less influenced by prior information
- d. MAP becomes equivalent to MLE

The correct answer is: MAP estimates become more influenced by prior information

Question **20**

Not answered

Marked out of 1.00

What distinguishes the E-step from the M-step in the EM algorithm?

- a. E-step updates parameters, while M-step computes likelihood.
- b. E-step maximizes the likelihood, while M-step computes expected values.
- c. E-step and M-step are identical.
- d. E-step involves computing expected values, while M-step involves maximizing the likelihood.

The correct answer is: E-step involves computing expected values, while M-step involves maximizing the likelihood.

Unit 4 - Part B C ►

Started on	Tuesday, 5 November 2024, 8:48 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:48 AM
Time taken	9 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In the EM algorithm, what does the "expectation" step involve?

- a. Updating the model parameters
- b. Maximizing the likelihood
- c. Computing the expected values of hidden variables
- d. Minimizing the loss function

The correct answer is: Computing the expected values of hidden variables

Question **2**

Not answered

Marked out of 1.00

What happens if the initial parameters provided to the EM algorithm are poorly chosen?

- a. Guarantees global convergence
- b. Slows down convergence
- c. Accelerates convergence
- d. Has no effect on convergence

The correct answer is: Slows down convergence

Question **3**

Not answered

Marked out of 1.00

What is the d-separation criterion for determining conditional independence in a Bayesian network?

- a. A set of nodes X is d-separated from another set of nodes Y by a set of nodes Z if there is no directed path between any node in X and any node in Y given Z
- b. A set of nodes X is d-separated from another set of nodes Y by a set of nodes Z if there is no common ancestor between any node in X and any node in Y given Z
- c. A set of nodes X is d-separated from another set of nodes Y by a set of nodes Z if there is no undirected path between any node in X and any node in Y given Z
- d. A set of nodes X is d-separated from another set of nodes Y by a set of nodes Z if there is no active trail between any node in X and any node in Y given Z

The correct answer is: A set of nodes X is d-separated from another set of nodes Y by a set of nodes Z if there is no active trail between any node in X and any node in Y given Z

Question **4**

Not answered

Marked out of 1.00

What does the adjusting factor α represent in Bayes' rule?

- a. Cherry-lime ratio
- b. Alpha candy flavor
- c. Adjusting factor for probabilities
- d. Bag type coefficient

The correct answer is: Adjusting factor for probabilities

Question **5**

Not answered

Marked out of 1.00

What is the primary objective of the Expectation-Maximization (EM) algorithm in density estimation?

- a. Maximizing the posterior probabilities
- b. Maximizing the observed data likelihood
- c. Minimizing the likelihood function
- d. Minimizing the conditional probabilities

The correct answer is: Maximizing the observed data likelihood

Question **6**

Not answered

Marked out of 1.00

What are some applications of the EM algorithm in statistical learning?

- a. Fully observable Bayesian networks
- b. Maximum-Likelihood learning
- c. Clustering using mixtures of Gaussians
- d. Nonparametric models

The correct answer is: Clustering using mixtures of Gaussians

Question **7**

Not answered

Marked out of 1.00

What is a potential limitation of the EM algorithm in density estimation?

- a. Inability to handle missing data
- b. Dependence on initial parameter values
- c. Fast convergence in all cases
- d. Sensitivity to outliers

The correct answer is: Sensitivity to outliers

Question **8**

Not answered

Marked out of 1.00

In the context of density estimation, what does nonparametric density estimation refer to?

- a. Learning the structure without estimating parameters
- b. Estimating parameters with a fixed model structure
- c. Estimating parameters without a model structure
- d. Focusing only on feature extraction

The correct answer is: Estimating parameters without a model structure

Question **9**

Not answered

Marked out of 1.00

What does P(X |d) represent in the context of Bayesian learning equations?

- a. Probability of candy wrapper color given candy flavor
- b. Probability of an unknown quantity given data
- c. Probability of bag type given candy flavor
- d. Probability of candy flavor given bag type

The correct answer is: Probability of an unknown quantity given data

Question **10**

Not answered

Marked out of 1.00

What is the significance of the prior probability, P(hi), in Bayesian learning?

- a. Determines candy flavors
- b. Influences candy wrapper design
- c. Defines candy manufacturing process
- d. Represents initial belief in each hypothesis

The correct answer is: Represents initial belief in each hypothesis

Question **11**

Not answered

Marked out of 1.00

How does Bayesian learning handle uncertainty in predictions compared to traditional methods?

- a. Incorporates uncertainty through probabilities
- b. Always relies on a single hypothesis
- c. Eliminates uncertainty completely
- d. Ignores uncertainty

The correct answer is: Incorporates uncertainty through probabilities

Question **12**

Not answered

Marked out of 1.00

What are the key quantities in the Bayesian approach, as mentioned in the content?

- a. Hypothesis prior and likelihood of the data
- b. Candy wrapper color and bag type
- c. Candy flavors and bag types
- d. Candy manufacturer and candy flavor

The correct answer is: Hypothesis prior and likelihood of the data

Question **13**

Not answered

Marked out of 1.00

In a Naive Bayes model, what is considered the root of the Bayesian network?

- a. Attribute variables
- b. Class variable
- c. Maximum-likelihood estimates
- d. Conditional probabilities

The correct answer is: Class variable

Question **14**

Not answered

Marked out of 1.00

In the EM algorithm, what is the role of the likelihood function during the maximization step?

- a. Represents the probability of hidden variables
- b. Represents the probability of observed data
- c. Represents the prior probabilities
- d. Represents the conditional probabilities

The correct answer is: Represents the probability of observed data

Question **15**

Not answered

Marked out of 1.00

Learning the structure of Bayesian networks is an example of what aspect of statistical learning?

- a. Maximum-Likelihood learning
- b. Nonparametric models
- c. Uniform prior selection
- d. Model selection

The correct answer is: Model selection

Question **16**

Not answered

Marked out of 1.00

What role does model selection play in statistical learning, specifically when learning the structure of Bayesian networks?

- a. Estimating hidden variables
- b. Trading off model complexity against the degree of fit
- c. Minimizing the likelihood
- d. Applying uniform priors

The correct answer is: Trading off model complexity against the degree of fit

Question **17**

Not answered

Marked out of 1.00

Which of the following is a key difference between MAP and MLE?

- a. MLE incorporates prior beliefs, while MAP does not
- b. MAP always produces higher estimates than MLE
- c. MLE is a special case of MAP
- d. MAP focuses on minimizing the likelihood

The correct answer is: MLE incorporates prior beliefs, while MAP does not

Question **18**

Not answered

Marked out of 1.00

When is data considered complete in the context of density estimation?

- a. When each data point contains values for every variable in the probability model
- b. When the data points are missing certain values
- c. When each data point contains values for only some variables
- d. When the data points contain values for a single variable

The correct answer is: When each data point contains values for every variable in the probability model

Question **19**

Not answered

Marked out of 1.00

What does the equation P(X |d) = Σ P(X |hi)P(hi |d) emphasize in Bayesian learning?

- a. Candy flavor diversity
- b. Bag type variations
- c. Candy manufacturing process
- d. Weighted averages over hypotheses for predictions

The correct answer is: Weighted averages over hypotheses for predictions

Question **20**

Not answered

Marked out of 1.00

What is the general task referred to as, involving learning a probability model from assumed data generation?

- a. Density estimation
- b. Parameter optimization
- c. Feature extraction
- d. Model selection

The correct answer is: Density estimation

Started on	Tuesday, 5 November 2024, 8:48 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:49 AM
Time taken	10 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What distinguishes nearest-neighbors methods in nonparametric models?

- a. They use uniform priors.
- b. They rely on Bayesian inference.
- c. They look at the examples nearest to the point in question.
- d. They involve a fixed number of parameters.

The correct answer is: They look at the examples nearest to the point in question.

Question **2**
Not answered
Marked out of 1.00

Maximum-Likelihood learning is equivalent to MAP learning with what type of prior?

- a. Prior without constraints
- b. Uniform prior
- c. Non-uniform prior
- d. Bayesian prior

The correct answer is: Uniform prior

Question **3**
Not answered
Marked out of 1.00

Which type of classification tasks is Naive Bayes particularly well-suited for?

- a. Reinforcement learning
- b. Image recognition
- c. Regression analysis
- d. Text classification

The correct answer is: Text classification

Question **4**

Not answered

Marked out of 1.00

How does the EM algorithm contribute to clustering in density estimation?

- a. By minimizing the likelihood
- b. By reducing dimensionality
- c. By discarding outliers
- d. By assigning each instance to a cluster

The correct answer is: By assigning each instance to a cluster

Question **5**

Not answered

Marked out of 1.00

What is a Bayesian network?

- a. A network that uses Bayes' theorem to update beliefs based on evidence
- b. A graphical model that represents probabilistic relationships among variables
- c. A network that learns from data using Bayesian inference
- d. All of the above

The correct answer is: All of the above

Question **6**

Not answered

Marked out of 1.00

How does the EM algorithm handle incomplete or missing data during the estimation process?

- a. Ignores missing data completely
- b. Discards instances with missing data
- c. Imputes missing values using mean imputation
- d. Iteratively estimates missing values

The correct answer is: Iteratively estimates missing values

Question **7**

Not answered

Marked out of 1.00

What is the primary reason the Naive Bayes model is referred to as "naive"?

- a. It assumes attributes are conditionally independent.
- b. It assumes attributes are conditionally dependent.
- c. It assumes attributes have equal importance.
- d. It assumes all attributes are independent.

The correct answer is: It assumes attributes are conditionally independent.

Question **8**

Not answered

Marked out of 1.00

What is the significance of the log-likelihood function in the EM algorithm?

- a. It represents the prior probabilities.
- b. It is unrelated to the algorithm.
- c. It is maximized during the maximization step.
- d. It is minimized during the expectation step.

The correct answer is: It is maximized during the maximization step.

Question **9**

Not answered

Marked out of 1.00

In Bayesian learning, what is the role of the adjusting factor α in Bayes' rule?

- a. Represents candy flavor diversity
- b. Determines bag type variations
- c. Adjusts probabilities to normalize them
- d. Influences candy wrapper color predictions

The correct answer is: Adjusts probabilities to normalize them

Question **10**

Not answered

Marked out of 1.00

What is the difference between a Bayesian network and an influence diagram?

- a. A Bayesian network represents only probabilistic relationships, while an influence diagram represents both probabilistic and decision-making relationships
- b. A Bayesian network represents only discrete variables, while an influence diagram represents both discrete and continuous variables
- c. A Bayesian network represents only causal relationships, while an influence diagram represents both causal and correlational relationships
- d. A Bayesian network represents only static variables, while an influence diagram represents both static and dynamic variables

The correct answer is: A Bayesian network represents only probabilistic relationships, while an influence diagram represents both probabilistic and decision-making relationships

Question **11**

Not answered

Marked out of 1.00

In the context of density estimation, what type of models is the EM algorithm commonly used for?

- a. Clustering
- b. Linear regression
- c. Gaussian mixture models
- d. Classification

The correct answer is: Gaussian mixture models

Question **12**

Not answered

Marked out of 1.00

When some variables are hidden, what algorithm can be used to find local maximum-likelihood solutions?

- a. Expectation-Maximization (EM)
- b. Gradient Descent
- c. Newton's Method
- d. K-Means Clustering

The correct answer is: Expectation-Maximization (EM)

Question **13**

Not answered

Marked out of 1.00

What is the key assumption made by the Naive Bayes model regarding the relationship between attributes?

- a. Attributes are conditionally independent, given the class.
- b. Attributes are irrelevant for classification.
- c. Attributes are always dependent on each other.
- d. Attributes are completely independent of the class.

The correct answer is: Attributes are conditionally independent, given the class.

Question **14**

Not answered

Marked out of 1.00

What is the purpose of the normalization constant (α) in the Naive Bayes probability calculation?

- a. To decrease model accuracy
- b. To increase computational complexity
- c. To ensure probabilities sum to one
- d. To weigh attributes equally

The correct answer is: To ensure probabilities sum to one

Question **15**

Not answered

Marked out of 1.00

What is the role of hypotheses in Bayesian learning?

- a. Candy wrapper design
- b. Candy manufacturing process
- c. Intermediaries between raw data and predictions
- d. Directly observable data

The correct answer is: Intermediaries between raw data and predictions

Question **16**

Not answered

Marked out of 1.00

What is the primary characteristic of the EM algorithm in handling hidden variables in statistical learning?

- a. It iteratively estimates hidden variables.
- b. It discards instances with hidden variables.
- c. It estimates hidden variables in a single step.
- d. It finds global maximum likelihood solutions.

The correct answer is: It iteratively estimates hidden variables.

Question **17**

Not answered

Marked out of 1.00

What role do conditional probabilities play in the Naive Bayes model?

- a. They model the independence assumption.
- b. They represent prior beliefs.
- c. They define the root of the Bayesian network.
- d. They determine class labels directly.

The correct answer is: They model the independence assumption.

Question **18**

Not answered

Marked out of 1.00

In the EM algorithm, what does the "expectation" step involve?

- a. Minimizing the loss function
- b. Updating the model parameters
- c. Computing the expected values of hidden variables
- d. Maximizing the likelihood

The correct answer is: Computing the expected values of hidden variables

Question **19**

Not answered

Marked out of 1.00

What are some applications of the EM algorithm in statistical learning?

- a. Fully observable Bayesian networks
- b. Maximum-Likelihood learning
- c. Clustering using mixtures of Gaussians
- d. Nonparametric models

The correct answer is: Clustering using mixtures of Gaussians

Question **20**

Not answered

Marked out of 1.00

What is the Markov blanket of a node in a Bayesian network?

- a. The set of nodes that are conditionally independent of the node
- b. The set of nodes that are reachable from the node
- c. The set of nodes that are d-separated from the node
- d. The set of nodes that are directly connected to the node

The correct answer is: The set of nodes that are directly connected to the node

Question **1**
Not answered
Marked out of 1.00

What does the equation P(X |d) = Σ P(X |hi)P(hi |d) represent?

- a. Probability of an unknown quantity given data
- b. Probability of candy flavor given bag type
- c. Probability of bag type given candy flavor
- d. Probability of candy wrapper color given candy flavor

The correct answer is: Probability of an unknown quantity given data

Question **2**
Not answered
Marked out of 1.00

What is the role of hypotheses in Bayesian learning?

- a. Directly observable data
- b. Candy manufacturing process
- c. Candy wrapper design
- d. Intermediaries between raw data and predictions

The correct answer is: Intermediaries between raw data and predictions

Question **3**
Not answered
Marked out of 1.00

In the context of density estimation, what type of models is the EM algorithm commonly used for?

- a. Linear regression
- b. Classification
- c. Clustering
- d. Gaussian mixture models

The correct answer is: Gaussian mixture models

Question **4**

Not answered

Marked out of 1.00

In the EM algorithm, what happens during each iteration of the E-step?

- a. Expected values of hidden variables are computed.
- b. Parameters are updated.
- c. Model likelihood is maximized.
- d. Observed data is ignored.

The correct answer is: Expected values of hidden variables are computed.

Question **5**

Not answered

Marked out of 1.00

How do nonparametric models represent a distribution in statistical learning?

- a. Using the collection of data points
- b. Employing uniform priors
- c. Using a fixed number of parameters
- d. Utilizing Bayesian priors

The correct answer is: Using the collection of data points

Question **6**

Not answered

Marked out of 1.00

When some variables are hidden, what algorithm can be used to find local maximum-likelihood solutions?

- a. Newton's Method
- b. Expectation-Maximization (EM)
- c. Gradient Descent
- d. K-Means Clustering

The correct answer is: Expectation-Maximization (EM)

Question **7**

Not answered

Marked out of 1.00

What determines a deterministic prediction in the Naive Bayes model?

- a. Maximum-likelihood estimates
- b. Highest posterior probability
- c. Random selection
- d. Bayesian priors

The correct answer is: Highest posterior probability

Question **8**

Not answered

Marked out of 1.00

What does the equation P(X |d) = Σ P(X |hi)P(hi |d) emphasize in Bayesian learning?

- a. Candy manufacturing process
- b. Bag type variations
- c. Candy flavor diversity
- d. Weighted averages over hypotheses for predictions

The correct answer is: Weighted averages over hypotheses for predictions

Question **9**

Not answered

Marked out of 1.00

What are the key quantities in the Bayesian approach, as mentioned in the content?

- a. Candy flavors and bag types
- b. Candy manufacturer and candy flavor
- c. Candy wrapper color and bag type
- d. Hypothesis prior and likelihood of the data

The correct answer is: Hypothesis prior and likelihood of the data

Question **10**

Not answered

Marked out of 1.00

When is data considered complete in the context of density estimation?

- a. When each data point contains values for every variable in the probability model
- b. When the data points contain values for a single variable
- c. When the data points are missing certain values
- d. When each data point contains values for only some variables

The correct answer is: When each data point contains values for every variable in the probability model

Question **11**

Not answered

Marked out of 1.00

What is required for trading off model complexity against the degree of fit in model selection?

- a. Discrete search in the space of structures
- b. Maximum-likelihood solutions
- c. Probabilistic inference
- d. Uniform priors

The correct answer is: Discrete search in the space of structures

Question **12**

Not answered

Marked out of 1.00

What does Ockham's razor provide a good way to implement in Bayesian learning methods?

- a. Uniform priors
- b. Maximum likelihood
- c. Hypothesis selection
- d. Minimum model complexity

The correct answer is: Minimum model complexity

Question **13**

Not answered

Marked out of 1.00

What is the primary characteristic of the EM algorithm in handling hidden variables in statistical learning?

- a. It discards instances with hidden variables.
- b. It iteratively estimates hidden variables.
- c. It estimates hidden variables in a single step.
- d. It finds global maximum likelihood solutions.

The correct answer is: It iteratively estimates hidden variables.

Question **14**

Not answered

Marked out of 1.00

What distinguishes nearest-neighbors methods in nonparametric models?

- a. They involve a fixed number of parameters.
- b. They use uniform priors.
- c. They look at the examples nearest to the point in question.
- d. They rely on Bayesian inference.

The correct answer is: They look at the examples nearest to the point in question.

Question **15**

Not answered

Marked out of 1.00

How does the EM algorithm contribute to clustering in density estimation?

- a. By discarding outliers
- b. By reducing dimensionality
- c. By assigning each instance to a cluster
- d. By minimizing the likelihood

The correct answer is: By assigning each instance to a cluster

Question **16**

Not answered

Marked out of 1.00

What is a Bayesian network?

- a. All of the above
- b. A network that learns from data using Bayesian inference
- c. A network that uses Bayes' theorem to update beliefs based on evidence
- d. A graphical model that represents probabilistic relationships among variables

The correct answer is: All of the above

Question **17**

Not answered

Marked out of 1.00

What does P(X |d) represent in the context of Bayesian learning equations?

- a. Probability of an unknown quantity given data
- b. Probability of candy flavor given bag type
- c. Probability of bag type given candy flavor
- d. Probability of candy wrapper color given candy flavor

The correct answer is: Probability of an unknown quantity given data

Question **18**

Not answered

Marked out of 1.00

What does a node in a Bayesian network represent?

- a. A conditional probability
- b. A marginal distribution
- c. A random variable
- d. A causal relationship

The correct answer is: A random variable

Question **19**

Not answered

Marked out of 1.00

In what cases can maximum-likelihood solutions be found easily in closed form?

- a. Complex hypothesis spaces
- b. Clustering using mixtures of Gaussians
- c. Nonlinear regression
- d. Fully observable Bayesian networks

The correct answer is: Fully observable Bayesian networks

Question **20**

Not answered

Marked out of 1.00

Originally, density estimation was applied to probability density functions for which type of variables?

- a. Discrete variables only
- b. Both continuous and discrete variables
- c. Continuous variables only
- d. Nominal variables only

The correct answer is: Continuous variables only

Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What is the primary objective of the Expectation-Maximization (EM) algorithm in density estimation?

- a. Maximizing the posterior probabilities
- b. Maximizing the observed data likelihood
- c. Minimizing the likelihood function
- d. Minimizing the conditional probabilities

The correct answer is: Maximizing the observed data likelihood

Question **2**
Not answered
Marked out of 1.00

What does the likelihood of the data under each hypothesis, P(d|hi), signify in Bayes' rule?

- a. Probability of bag type given data
- b. Probability of bag type given candy flavor
- c. Probability of candy flavor given bag type
- d. Measure of how well the data fits a hypothesis

The correct answer is: Measure of how well the data fits a hypothesis

Question **3**
Not answered
Marked out of 1.00

In nonparametric models, how do nearest-neighbors methods make predictions?

- a. By uniformly weighting all examples
- b. By looking at the examples nearest to the point in question
- c. By employing Bayesian priors
- d. By using a fixed set of parameters

The correct answer is: By looking at the examples nearest to the point in question

Question **4**

Not answered

Marked out of 1.00

What is the primary goal of Maximum Likelihood Estimation (MLE)?

- a. Minimize the prior probability
- b. Maximize the likelihood of observed data
- c. Minimize the posterior probability
- d. Maximize the number of hypotheses

The correct answer is: Maximize the likelihood of observed data

Question **5**

Not answered

Marked out of 1.00

What are the three types of connections between nodes in a Bayesian network?

- a. Forward, backward, and bidirectional
- b. Serial, parallel, and diverging
- c. Head-to-head, head-to-tail, and tail-to-tail
- d. Causal, evidential, and intercausal

The correct answer is: Head-to-head, head-to-tail, and tail-to-tail

Question **6**

Not answered

Marked out of 1.00

In density estimation, what does parameter learning specifically focus on?

- a. Finding numerical parameters for a fixed probability model structure
- b. Ignoring numerical parameters and focusing on structure
- c. Learning the entire probability model
- d. Finding the structure of the probability model

The correct answer is: Finding numerical parameters for a fixed probability model structure

Question **7**

Not answered

Marked out of 1.00

What are the two components of a Bayesian network?

- a. Queries and evidence
- b. Parameters and probabilities
- c. Nodes and edges
- d. Variables and values

The correct answer is: Nodes and edges

Question **8**

Not answered

Marked out of 1.00

What is the primary goal of nonparametric models in statistical learning?

- a. Representing distributions using a fixed number of parameters
- b. Utilizing Bayesian inference
- c. Representing distributions using data points
- d. Minimizing model complexity

The correct answer is: Representing distributions using data points

Question **9**

Not answered

Marked out of 1.00

Which of the following scenarios is suitable for using Maximum Likelihood Estimation (MLE)?

- a. When the sample size is small
- b. When prior information is available and reliable
- c. When the likelihood function is not well-defined
- d. When the data distribution is unknown

The correct answer is: When the sample size is small

Question **10**

Not answered

Marked out of 1.00

What does the number of parameters in nonparametric models grow with?

- a. Size of the training set
- b. Collection of data points
- c. Number of features
- d. Model complexity

The correct answer is: Size of the training set

Question **11**

Not answered

Marked out of 1.00

Which of the following is a key difference between MAP and MLE?

- a. MLE is a special case of MAP
- b. MAP always produces higher estimates than MLE
- c. MLE incorporates prior beliefs, while MAP does not
- d. MAP focuses on minimizing the likelihood

The correct answer is: MLE incorporates prior beliefs, while MAP does not

Question **12**

Not answered

Marked out of 1.00

What is the primary reason the Naive Bayes model is referred to as "naive"?

- a. It assumes attributes are conditionally dependent.
- b. It assumes attributes are conditionally independent.
- c. It assumes attributes have equal importance.
- d. It assumes all attributes are independent.

The correct answer is: It assumes attributes are conditionally independent.

Question **13**

Not answered

Marked out of 1.00

In the context of density estimation, what does nonparametric density estimation refer to?

- a. Learning the structure without estimating parameters
- b. Focusing only on feature extraction
- c. Estimating parameters without a model structure
- d. Estimating parameters with a fixed model structure

The correct answer is: Estimating parameters without a model structure

Question **14**

Not answered

Marked out of 1.00

What is the primary focus of Bayesian learning methods in statistical learning?

- a. Minimizing model complexity
- b. Selecting hypotheses based on maximum likelihood
- c. Utilizing Ockham's razor for hypothesis selection
- d. Formulating learning as probabilistic inference

The correct answer is: Formulating learning as probabilistic inference

Question **15**

Not answered

Marked out of 1.00

What is a potential limitation of the EM algorithm in statistical learning?

- a. Sensitivity to outliers
- b. Independence of initial parameter values
- c. Inability to handle missing data
- d. Fast convergence in all cases

The correct answer is: Sensitivity to outliers

Question **16**

Not answered

Marked out of 1.00

What distinguishes the E-step from the M-step in the EM algorithm?

- a. E-step maximizes the likelihood, while M-step computes expected values.
- b. E-step and M-step are identical.
- c. E-step updates parameters, while M-step computes likelihood.
- d. E-step involves computing expected values, while M-step involves maximizing the likelihood.

The correct answer is: E-step involves computing expected values, while M-step involves maximizing the likelihood.

Question **17**

Not answered

Marked out of 1.00

How does the Naive Bayes model handle new examples during the classification phase?

- a. By calculating posterior probabilities
- b. By discarding them
- c. By using Bayesian priors only
- d. By updating the model

The correct answer is: By calculating posterior probabilities

Question **18**

Not answered

Marked out of 1.00

In a Naive Bayes model, what is considered the root of the Bayesian network?

- a. Maximum-likelihood estimates
- b. Class variable
- c. Attribute variables
- d. Conditional probabilities

The correct answer is: Class variable

Question **19**

Not answered

Marked out of 1.00

What is the main advantage of incorporating prior information in MAP estimation?

- a. Increased computational complexity
- b. Improved robustness in small sample sizes
- c. Faster convergence of algorithms
- d. Reduced accuracy in parameter estimation

The correct answer is: Improved robustness in small sample sizes

Question **20**

Not answered

Marked out of 1.00

What role does model selection play in statistical learning, specifically when learning the structure of Bayesian networks?

- a. Applying uniform priors
- b. Estimating hidden variables
- c. Minimizing the likelihood
- d. Trading off model complexity against the degree of fit

The correct answer is: Trading off model complexity against the degree of fit

Time taken	9 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What is the impact of increasing the number of clusters in a Gaussian Mixture Model (GMM) estimated by the EM algorithm?

- a. Has no effect on the model
- b. Decreases model flexibility
- c. Improves convergence speed
- d. Increases model complexity

The correct answer is: Increases model complexity

Question **2**
Not answered
Marked out of 1.00

How does Bayesian learning handle uncertainty in predictions compared to traditional methods?

- a. Eliminates uncertainty completely
- b. Always relies on a single hypothesis
- c. Incorporates uncertainty through probabilities
- d. Ignores uncertainty

The correct answer is: Incorporates uncertainty through probabilities

Question **3**
Not answered
Marked out of 1.00

What is the general task referred to as, involving learning a probability model from assumed data generation?

- a. Feature extraction
- b. Density estimation
- c. Model selection
- d. Parameter optimization

The correct answer is: Density estimation

Question **4**

Not answered

Marked out of 1.00

In the EM algorithm, what is the role of the likelihood function during the maximization step?

- a. Represents the prior probabilities
- b. Represents the probability of observed data
- c. Represents the probability of hidden variables
- d. Represents the conditional probabilities

The correct answer is: Represents the probability of observed data

Question **5**

Not answered

Marked out of 1.00

Which term is often associated with the latent or hidden variables in the context of the EM algorithm?

- a. Complete data
- b. M-step
- c. E-step
- d. Maximization

The correct answer is: E-step

Question **6**

Not answered

Marked out of 1.00

Maximum-Likelihood learning is equivalent to MAP learning with what type of prior?

- a. Non-uniform prior
- b. Uniform prior
- c. Prior without constraints
- d. Bayesian prior

The correct answer is: Uniform prior

Question **7**

Not answered

Marked out of 1.00

What is the main challenge addressed by the EM algorithm in the context of density estimation?

- a. Handling missing data
- b. Unsupervised learning
- c. Model selection
- d. Overfitting

The correct answer is: Handling missing data

Question **8**

Not answered

Marked out of 1.00

What does Maximum a Posteriori (MAP) learning aim to select given the data?

- a. The hypothesis with minimum complexity
- b. The least likely hypothesis
- c. All possible hypotheses
- d. A single most likely hypothesis

The correct answer is: A single most likely hypothesis

Question **9**

Not answered

Marked out of 1.00

What does an edge in a Bayesian network represent?

- a. A correlation
- b. A dependency
- c. A logical implication
- d. A direct influence

The correct answer is: A direct influence

Question **10**

Not answered

Marked out of 1.00

How are maximum-likelihood parameter values estimated in the Naive Bayes model?

- a. From the training data
- b. Randomly selecting values
- c. Using gradient descent
- d. Based on Bayesian priors

The correct answer is: From the training data

Question **11**

Not answered

Marked out of 1.00

Which formula is used to calculate the probability of each hypothesis in Bayes' rule?

- a. P(hi |d) = P(d|hi)P(hi)
- b. P(hi) = P(hi |d) / P(d|hi)
- c. P(hi) = P(d|hi)P(hi |d)
- d. P(hi |d) = P(hi) / P(d|hi)

The correct answer is: P(hi |d) = P(d|hi)P(hi)

Question **12**

Not answered

Marked out of 1.00

In Bayesian statistics, what does MAP stand for?

- a. Maximum Approximation Posterior
- b. Maximum A Posteriori
- c. Maximum Approximation Probability
- d. Minimum A Posteriori Probability

The correct answer is: Maximum A Posteriori

Question **13**

Not answered

Marked out of 1.00

How does the EM algorithm contribute to the robustness of density estimation models?

- a. By ignoring outliers
- b. By handling incomplete data gracefully
- c. By relying on large datasets
- d. By increasing model complexity

The correct answer is: By handling incomplete data gracefully

Question **14**

Not answered

Marked out of 1.00

What type of probability model is mentioned for learning conditional probabilities?

- a. Gaussian mixture model
- b. Markov chain model
- c. Bayesian network model
- d. Decision tree model

The correct answer is: Bayesian network model

Question **15**

Not answered

Marked out of 1.00

What is the primary focus of learning structure in the density estimation process?

- a. Identifying the structure of the probability model
- b. Determining the numerical parameters
- c. Selecting the appropriate model
- d. Extracting features from the data

The correct answer is: Identifying the structure of the probability model

Question **16**

Not answered

Marked out of 1.00

What is the significance of the log-likelihood function in the EM algorithm?

- a. It is minimized during the expectation step.
- b. It represents the prior probabilities.
- c. It is maximized during the maximization step.
- d. It is unrelated to the algorithm.

The correct answer is: It is maximized during the maximization step.

Question **17**

Not answered

Marked out of 1.00

What is the general nature of the EM algorithm's convergence in density estimation?

- a. May converge to local optima
- b. Converges only for linear models
- c. Always converges to a global minimum
- d. Convergence is not relevant

The correct answer is: May converge to local optima

Question **18**

Not answered

Marked out of 1.00

Which of the following statements is true regarding MAP estimation?

- a. It always leads to the same result as MLE
- b. It is equivalent to minimizing the prior probability
- c. It balances prior beliefs with observed data
- d. It accounts for uncertainties through likelihood only

The correct answer is: It balances prior beliefs with observed data

Question **19**

Not answered

Marked out of 1.00

k-means algorithm is used when

- a. clusters are distinct
- b. clusters are globular
- c. clusters are obtained from real-time data
- d. clusters are overlapping

The correct answer is: clusters are distinct

Question **20**

Not answered

Marked out of 1.00

How does Bayesian learning handle predictions compared to traditional methods?

- a. By using weighted averages over all hypotheses
- b. By using raw data only
- c. By ignoring hypotheses
- d. By using a single "best" hypothesis

The correct answer is: By using weighted averages over all hypotheses

Time taken	6 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What does the probability expression P(C | x1, x2, ..., xn) represent in the Naive Bayes model?

- a. Conditional probability of C
- b. Prior probability of C
- c. Posterior probability of C
- d. Likelihood probability of C

The correct answer is: Posterior probability of C

Question **2**
Not answered
Marked out of 1.00

What is the significance of the prior probability, P(hi), in Bayesian learning?

- a. Represents initial belief in each hypothesis
- b. Determines candy flavors
- c. Influences candy wrapper design
- d. Defines candy manufacturing process

The correct answer is: Represents initial belief in each hypothesis

Question **3**
Not answered
Marked out of 1.00

What role does the "maximization" step play in the EM algorithm for density estimation?

- a. Computing expected values
- b. Estimating hidden variables
- c. Updating the observed data likelihood
- d. Maximizing the likelihood with respect to parameters

The correct answer is: Maximizing the likelihood with respect to parameters

Question **4**

Not answered

Marked out of 1.00

What is the difference between a Bayesian network and an influence diagram?

- a. A Bayesian network represents only static variables, while an influence diagram represents both static and dynamic variables
- b. A Bayesian network represents only discrete variables, while an influence diagram represents both discrete and continuous variables
- c. A Bayesian network represents only causal relationships, while an influence diagram represents both causal and correlational relationships
- d. A Bayesian network represents only probabilistic relationships, while an influence diagram represents both probabilistic and decision-making relationships

The correct answer is: A Bayesian network represents only probabilistic relationships, while an influence diagram represents both probabilistic and decision-making relationships

Question **5**

Not answered

Marked out of 1.00

How does MAP learning differ from full Bayesian learning?

- a. It is often more tractable for complex spaces.
- b. It does not involve hypothesis priors.
- c. It considers all possible hypotheses.
- d. It uses a uniform prior.

The correct answer is: It does not involve hypothesis priors.

Question **6**

Not answered

Marked out of 1.00

What is a key characteristic of nonparametric models in terms of the number of parameters?

- a. It remains constant regardless of the training set size.
- b. It is independent of the number of features.
- c. It grows with the training set size.
- d. It decreases as the model complexity increases.

The correct answer is: It grows with the training set size.

Question **7**

Not answered

Marked out of 1.00

What role do conditional probabilities play in the Naive Bayes model?

- a. They represent prior beliefs.
- b. They model the independence assumption.
- c. They determine class labels directly.
- d. They define the root of the Bayesian network.

The correct answer is: They model the independence assumption.

Question **8**

Not answered

Marked out of 1.00

In statistical learning, what impact does increasing the number of clusters in a Gaussian Mixture Model (GMM) have?

- a. Increases model complexity
- b. Decreases model flexibility
- c. Improves convergence speed
- d. Has no effect on the model

The correct answer is: Increases model complexity

Question **9**

Not answered

Marked out of 1.00

In the EM algorithm, what does the log-likelihood function represent during the expectation step?

- a. Probability of observed data
- b. Probability of model parameters
- c. Probability of hidden variables
- d. Probability of missing data

The correct answer is: Probability of hidden variables

Question **10**

Not answered

Marked out of 1.00

What is the key assumption made by the Naive Bayes model regarding the relationship between attributes?

- a. Attributes are irrelevant for classification.
- b. Attributes are conditionally independent, given the class.
- c. Attributes are completely independent of the class.
- d. Attributes are always dependent on each other.

The correct answer is: Attributes are conditionally independent, given the class.

Question **11**

Not answered

Marked out of 1.00

What is a particularly effective technique that scales well in simple cases like linear regression?

- a. Nonparametric models
- b. MAP learning
- c. Maximum-likelihood learning
- d. Naive Bayes learning

The correct answer is: Naive Bayes learning

Question **12**

Not answered

Marked out of 1.00

What does the adjusting factor α represent in Bayes' rule?

- a. Cherry-lime ratio
- b. Adjusting factor for probabilities
- c. Alpha candy flavor
- d. Bag type coefficient

The correct answer is: Adjusting factor for probabilities

Question **13**

Not answered

Marked out of 1.00

Which type of classification tasks is Naive Bayes particularly well-suited for?

- a. Text classification
- b. Image recognition
- c. Regression analysis
- d. Reinforcement learning

The correct answer is: Text classification

Question **14**

Not answered

Marked out of 1.00

In the context of the EM algorithm, what does the term "latent variables" refer to?

- a. Observed data
- b. Variables with missing data
- c. Parameters of the model
- d. Variables not directly observed

The correct answer is: Variables not directly observed

Question **15**

Not answered

Marked out of 1.00

What does MLE stand for in the context of statistical estimation?

- a. Maximum Likelihood Estimation
- b. Minimum Likelihood Estimation
- c. Minimum Learning Experience
- d. Maximum Learning Experience

The correct answer is: Maximum Likelihood Estimation

Question **16**

Not answered

Marked out of 1.00

How do kernel methods in nonparametric models combine examples for prediction?

- a. Uniformly weighted combination
- b. Distance-weighted combination
- c. Maximum-likelihood combination
- d. Bayesian-weighted combination

The correct answer is: Distance-weighted combination

Question **17**

Not answered

Marked out of 1.00

What happens if the initial parameters provided to the EM algorithm are poorly chosen?

- a. Guarantees global convergence
- b. Slows down convergence
- c. Accelerates convergence
- d. Has no effect on convergence

The correct answer is: Slows down convergence

Question **18**

Not answered

Marked out of 1.00

What happens to MAP estimation when the amount of prior information increases?

- a. MAP estimates become more influenced by prior information
- b. MAP becomes computationally infeasible
- c. MAP estimates become less influenced by prior information
- d. MAP becomes equivalent to MLE

The correct answer is: MAP estimates become more influenced by prior information

Question **19**

Not answered

Marked out of 1.00

What type of distributions are effectively modeled using the EM algorithm in statistical learning?

- a. Exponential distributions
- b. Poisson distributions
- c. Uniform distributions
- d. Gaussian distributions

The correct answer is: Gaussian distributions

Question **20**

Not answered

Marked out of 1.00

What is the advantage of using a Bayesian network over a full joint probability distribution?

- a. A Bayesian network can represent complex domains with fewer parameters
- b. A Bayesian network can perform inference and learning more efficiently
- c. All of the above
- d. A Bayesian network can handle missing data and uncertainty better

The correct answer is: A Bayesian network can represent complex domains with fewer parameters

◄ Activity: Gaussian Distribution Function

Unit 4 - Part B C ►

Started on	Tuesday, 5 November 2024, 11:33 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:33 AM
Time taken	11 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

Which RL algorithm, when combined with function approximation, involves maintaining both a policy function (actor) and a value function (critic)?

- a. Policy Gradient Methods
- b. SARSA
- c. Q-learning
- d. Actor-Critic Methods

Your answer is incorrect.

The correct answer is: Actor-Critic Methods

Question **2**

Not answered

Marked out of 1.00

What is the main characteristic of Policy Gradient Methods in reinforcement learning?

- a. They directly parameterize the policy and update the policy parameters.
- b. They use deep neural networks for function approximation.
- c. They reduce variance in the actor's policy gradient updates.
- d. They maintain both a policy function and a value function.

Your answer is incorrect.

The correct answer is: They directly parameterize the policy and update the policy parameters.

Question **3**

Not answered

Marked out of 1.00

What issue may arise when combining function approximation methods, especially non-linear approximators like neural networks, with off-policy learning methods such as Q-learning?

- a. Reduced computational complexity
- b. Improved stability in learning
- c. Enhanced exploration strategy
- d. Instability and divergence

Your answer is incorrect.

The correct answer is: Instability and divergence

Question **4**

Not answered

Marked out of 1.00

What is a potential drawback of using function approximation in reinforcement learning?

- a. Increased interpretability
- b. Improved convergence speed
- c. Reduced computational complexity
- d. Risk of approximation errors

Your answer is incorrect.

The correct answer is: Risk of approximation errors

Question **5**

Not answered

Marked out of 1.00

What is a key characteristic of non-linear function approximation techniques such as neural networks in reinforcement learning?

- a. They are primarily based on decision trees.
- b. They rely on a weighted sum of features.
- c. They capture more complex relationships between state features and values.
- d. They use polynomial representations.

Your answer is incorrect.

The correct answer is: They capture more complex relationships between state features and values.

Question **6**

Not answered

Marked out of 1.00

What is Neural Fitted Q-Iteration (NFQ) primarily designed for in reinforcement learning?

- a. Function approximation
- b. Feature selection
- c. Monte Carlo simulation
- d. Policy optimization

Your answer is incorrect.

The correct answer is: Function approximation

Question **7**

Not answered

Marked out of 1.00

How are the parameters of the separate target network (Θ) updated in NFQ?

- a. They are not updated; they remain fixed throughout training.
- b. They are updated with the current neural network parameters periodically.
- c. They are updated based on the rewards received.
- d. They are updated continuously during training.

Your answer is incorrect.

The correct answer is: They are updated with the current neural network parameters periodically.

Question **8**

Not answered

Marked out of 1.00

Which type of neural network architecture is commonly used in Neural Fitted Q Iteration?

- a. Long Short-Term Memory (LSTM) networks
- b. Feedforward Neural Networks (FNNs)
- c. Convolutional Neural Networks (CNNs)
- d. Recurrent Neural Networks (RNN)

Your answer is incorrect.

The correct answer is: Feedforward Neural Networks (FNNs)

Question **9**

Not answered

Marked out of 1.00

What are the core targets used for estimating the action-value function of a policy in the context of NFQ implementation?

- a. SARSA target and Q-learning target
- b. Monte Carlo target and lambda target
- c. SARSA target and temporal-difference target
- d. Temporal-difference target and n-step target

Your answer is incorrect.

The correct answer is: Temporal-difference target and n-step target

Question **10**

Not answered

Marked out of 1.00

How does NFQ compute the target Q-value for each experience in the mini-batch?

- a. It uses the reward and the discounted maximum Q-value of the next state.
- b. It considers the average Q-value of the next state.
- c. It considers the discounted maximum Q-value of the next state.
- d. It uses the reward only.

Your answer is incorrect.

The correct answer is: It uses the reward and the discounted maximum Q-value of the next state.

Question **11**

Not answered

Marked out of 1.00

What is the purpose of the replay buffer in experience replay?

- a. To increase the size of each mini-batch
- b. To sample mini-batches from a broad set of past experiences
- c. To hold the entire dataset
- d. To speed up the training process

Your answer is incorrect.

The correct answer is: To sample mini-batches from a broad set of past experiences

Question **12**

Not answered

Marked out of 1.00

What is the purpose of the target network in the context of DQN (Deep Q-Network)?

- a. To provide additional input to the main network
- b. To create dynamic targets for the agent
- c. To improve the non-linear function approximation of the main network
- d. To fix targets and mitigate the issue of "chasing your own tail"

Your answer is incorrect.

The correct answer is: To fix targets and mitigate the issue of "chasing your own tail"

Question **13**

Not answered

Marked out of 1.00

How can the non-stationarity issue be mitigated to some extent in reinforcement learning?

- a. By using smaller networks
- b. By decreasing the update frequency of the target network
- c. By increasing the size of the neural networks
- d. By reducing the interaction time with the environment

Your answer is incorrect.

The correct answer is: By increasing the size of the neural networks

Question **14**

Not answered

Marked out of 1.00

What is the purpose of having two instances of neural network weights for the target network and online network?

- a. To introduce randomness in the learning process
- b. To increase model complexity
- c. To improve convergence speed
- d. To mitigate issues related to weight updates

Your answer is incorrect.

The correct answer is: To improve convergence speed

Question **15**

Not answered

Marked out of 1.00

What does the actor-critic method aim to maximize during training?

- a. Future rewards
- b. Variance in policy updates
- c. The number of iterations per episode
- d. Immediate rewards

Your answer is incorrect.

The correct answer is: Future rewards

Question **16**

Not answered

Marked out of 1.00

Why is the critic's feedback important in Actor-Critic methods?

- a. To minimize future rewards
- b. To parameterize the policy function
- c. To reduce the variance of policy updates
- d. To maximize immediate rewards

Your answer is incorrect.

The correct answer is: To reduce the variance of policy updates

Question **17**

Not answered

Marked out of 1.00

In Actor-Critic methods, what is the purpose of using policy gradient methods during the "Actor Update" phase?

- a. To maximize immediate rewards.
- b. To refine parameters continuously.
- c. To reduce the variance of the gradient estimate using the critic's value function.
- d. To increase the variance of gradient estimates.

Your answer is incorrect.

The correct answer is: To reduce the variance of the gradient estimate using the critic's value function.

Question **18**

Not answered

Marked out of 1.00

In model-based RL, why is planning considered a key component?

- a. It reduces the need for a model of the environment.
- b. It avoids the use of computational resources.
- c. It allows the agent to learn from actual experience.
- d. It helps the agent make more informed decisions by simulating future scenarios.

Your answer is incorrect.

The correct answer is: It helps the agent make more informed decisions by simulating future scenarios.

Question **19**

Not answered

Marked out of 1.00

In Model-Based RL, what is the primary goal of the agent?

- a. To optimize the agent's architecture
- b. To explicitly learn a model of the environment
- c. To learn a policy or value function directly
- d. To interact with the environment without learning

Your answer is incorrect.

The correct answer is: To explicitly learn a model of the environment

Question **20**

Not answered

Marked out of 1.00

What does "planning" refer to in the context of Reinforcement Learning (RL)?

- a. The simulation of different actions and prediction of their outcomes
- b. The adjustment of the agent's architecture
- c. The execution of predefined actions
- d. The process of making decisions based on historical data

Your answer is incorrect.

The correct answer is: The simulation of different actions and prediction of their outcomes

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 11:34 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:34 AM
Time taken	9 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

Which statement accurately describes the role of target networks in addressing instability and divergence in function approximation?

- a. Target networks increase correlation in Q-value updates.
- b. Target networks introduce additional exploration in the learning process.
- c. Target networks eliminate the need for experience replay.
- d. Target networks provide a fixed Q-value target, stabilizing the training process.

Your answer is incorrect.

The correct answer is: Target networks provide a fixed Q-value target, stabilizing the training process.

Question **2**

Not answered

Marked out of 1.00

What does "dimensionality" refer to in the context of state spaces?

- a. The number of variables that comprise a single state.
- b. The color channels in an image-based state representation.
- c. The size of the action space.
- d. The number of dimensions in the physical environment.

Your answer is incorrect.

The correct answer is: The number of variables that comprise a single state.

Question **3**

Not answered

Marked out of 1.00

Which type of function approximation utilizes a simple approach where the value function is represented as a weighted sum of features extracted from the state or state-action pair?

- a. Deep Q-networks
- b. Linear Function Approximation
- c. Polynomial Function Approximation
- d. Non-linear Function Approximation

Your answer is incorrect.

The correct answer is: Linear Function Approximation

Question **4**

Not answered

Marked out of 1.00

What is the main drawback of using tabular reinforcement learning in complex problems?

- a. Lack of exploration strategy
- b. Impracticality in handling high-dimensional state spaces
- c. Difficulty in defining rewards
- d. Limited computational power

Your answer is incorrect.

The correct answer is: Impracticality in handling high-dimensional state spaces

Question **5**

Not answered

Marked out of 1.00

Which technique is commonly used in reinforcement learning to approximate the value functions in situations where the state or action space is too large?

- a. Policy Iteration
- b. Function Approximation
- c. Q-Learning
- d. Monte Carlo Methods

Your answer is incorrect.

The correct answer is: Function Approximation

Question **6**

Not answered

Marked out of 1.00

Which loss function does NFQ typically use to measure the discrepancy between predicted Q-values and target Q-values?

- a. Mean Absolute Error (MAE) Loss
- b. Cross-Entropy Loss
- c. Mean Squared Error (MSE) Loss
- d. Huber Loss

Your answer is incorrect.

The correct answer is: Mean Squared Error (MSE) Loss

Question **7**

Not answered

Marked out of 1.00

What distinguishes the on-policy version of the TD target from the off-policy version?

- a. The choice between SARSA target and Q-learning target
- b. The use of lambda target
- c. The use of n-step target
- d. The way the action-value function is estimated

Your answer is incorrect.

The correct answer is: The choice between SARSA target and Q-learning target

Question **8**

Not answered

Marked out of 1.00

What is the primary advantage of using Neural Fitted Q-Iteration over traditional Q-learning methods?

- a. Improved exploration strategy
- b. Faster convergence to the optimal policy
- c. Reduced computational complexity
- d. Better handling of large state spaces

Your answer is incorrect.

The correct answer is: Better handling of large state spaces

Question **9**

Not answered

Marked out of 1.00

How are the network parameters (weights and biases) of the neural network adjusted during training in NFQ?

- a. They are adjusted based on the reward received.
- b. They are fixed and not adjusted.
- c. They are adjusted to minimize the difference between predicted and target Q-values.
- d. They are adjusted to maximize the Q-values.

Your answer is incorrect.

The correct answer is: They are adjusted to minimize the difference between predicted and target Q-values.

Question **10**

Not answered

Marked out of 1.00

In Neural Fitted Q-Iteration, what role do neural networks play in the learning process?

- a. They approximate the Q-function and improve its accuracy.
- b. They reduce the dimensionality of the state space.
- c. They determine the exploration strategy of the agent.
- d. They optimize the policy directly.

Your answer is incorrect.

The correct answer is: They approximate the Q-function and improve its accuracy.

Question **11**

Not answered

Marked out of 1.00

What does the term "frequently" mean in the context of updating the weights of the target network?

- a. Only at the beginning of the training process
- b. Every step in the learning process
- c. After convergence is achieved
- d. Depending on the problem, with a variable frequency

Your answer is incorrect.

The correct answer is: Depending on the problem, with a variable frequency

Question **12**

Not answered

Marked out of 1.00

What role does the target network serve in DQN?

- a. It predicts the rewards for each action
- b. It determines the learning rate.
- c. It stabilizes the training process by providing fixed targets
- d. It determines the exploration rate during training

Your answer is incorrect.

The correct answer is: It stabilizes the training process by providing fixed targets

Question **13**

Not answered

Marked out of 1.00

How is the target network kept synchronized with the online network in reinforcement learning?

- a. By randomly updating the target network weights
- b. By using a separate optimization algorithm for the target network
- c. By freezing and frequently updating the weights of the target network
- d. By freezing the target network weights indefinitely

Your answer is incorrect.

The correct answer is: By freezing and frequently updating the weights of the target network

Question **14**

Not answered

Marked out of 1.00

What technique is suggested to improve the temporal correlation issue in NFQ experiments?

- a. Batch normalization
- b. Learning rate annealing
- c. Experience replay
- d. Gradient descent

Your answer is incorrect.

The correct answer is: Experience replay

Question **15**

Not answered

Marked out of 1.00

What does the "Actor Update" phase rely on in the Actor-Critic method?

- a. The critic's value function.
- b. The reward from the environment.
- c. The state-action pairs.
- d. The actor's selected actions.

Your answer is incorrect.

The correct answer is: The critic's value function.

Question **16**

Not answered

Marked out of 1.00

How does the "Critic" component contribute to the Actor-Critic method?

- a. By parameterizing the policy function
- b. By selecting actions in a given state
- c. By estimating the variance of policy updates
- d. By critiquing the actions made by the actor

Your answer is incorrect.

The correct answer is: By critiquing the actions made by the actor

Question **17**

Not answered

Marked out of 1.00

How does the "Critic Update" phase contribute to the Actor-Critic method?

- a. By refining parameters continuously.
- b. By selecting actions based on the policy.
- c. By updating the actor's policy.
- d. By updating its value function based on reward and the new state.

Your answer is incorrect.

The correct answer is: By updating its value function based on reward and the new state.

Question **18**

Not answered

Marked out of 1.00

How does planning in model-based RL differ from model-free RL?

- a. Model-free RL involves predefined actions, while model-based RL uses simulations.
- b. Model-based RL uses simulations, while model-free RL relies on actual experience.
- c. Planning is equally important in both model-based and model-free RL.
- d. Model-free RL is computationally intensive, while model-based RL is less resource-intensive.

Your answer is incorrect.

The correct answer is: Model-based RL uses simulations, while model-free RL relies on actual experience.

Question **19**

Not answered

Marked out of 1.00

What is the primary characteristic of techniques like value iteration and policy iteration in RL?

- a. They extend the ideas of AlphaZero to unknown environments.
- b. They focus on continuous control with a probabilistic model.
- c. They are model-free and involve direct learning from experience.
- d. They are model-based and require planning.

Your answer is incorrect.

The correct answer is: They are model-based and require planning.

Question **20**

Not answered

Marked out of 1.00

What characterizes Model-Free RL methods?

- a. They learn a policy or value function directly.
- b. They avoid interactions with the environment.
- c. They explicitly learn a model of the environment.
- d. They simulate and predict future states and rewards.

Your answer is incorrect.

The correct answer is: They learn a policy or value function directly.

Started on	Tuesday, 5 November 2024, 11:35 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:35 AM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the purpose of adjusting weights during learning in linear function approximation?

- a. To optimize the policy directly.
- b. To minimize the error in the value function prediction.
- c. To minimize the error in the exploration strategy.
- d. To ensure a more accurate representation of the environment.

Your answer is incorrect.

The correct answer is: To minimize the error in the value function prediction.

Question **2**

Not answered

Marked out of 1.00

What is a key characteristic of non-linear function approximation techniques such as neural networks in reinforcement learning?

- a. They rely on a weighted sum of features.
- b. They are primarily based on decision trees.
- c. They capture more complex relationships between state features and values.
- d. They use polynomial representations.

Your answer is incorrect.

The correct answer is: They capture more complex relationships between state features and values.

Question **3**

Not answered

Marked out of 1.00

What issue may arise when combining function approximation methods, especially non-linear approximators like neural networks, with off-policy learning methods such as Q-learning?

- a. Improved stability in learning
- b. Reduced computational complexity
- c. Instability and divergence
- d. Enhanced exploration strategy

Your answer is incorrect.

The correct answer is: Instability and divergence

Question **4**

Not answered

Marked out of 1.00

What is the main drawback of using tabular reinforcement learning in complex problems?

- a. Difficulty in defining rewards
- b. Impracticality in handling high-dimensional state spaces
- c. Lack of exploration strategy
- d. Limited computational power

Your answer is incorrect.

The correct answer is: Impracticality in handling high-dimensional state spaces

Question **5**

Not answered

Marked out of 1.00

Which technique is commonly used in reinforcement learning to approximate the value functions in situations where the state or action space is too large?

- a. Q-Learning
- b. Policy Iteration
- c. Function Approximation
- d. Monte Carlo Methods

Your answer is incorrect.

The correct answer is: Function Approximation

Question **6**

Not answered

Marked out of 1.00

What are the key assumptions for gradient descent to be a stable optimization method?

- a. Targets must be non-stationary.
- b. Data must be independent and identically distributed (IID).
- c. Targets must be dynamic.
- d. Data must be dependent and identically distributed (DID).

Your answer is incorrect.

The correct answer is: Data must be independent and identically distributed (IID).

Question **7**

Not answered

Marked out of 1.00

What is Neural Fitted Q Iteration (NFQ)?

- a. Employs genetic algorithms for optimization
- b. A reinforcement learning algorithm for training deep neural networks
- c. A technique for data preprocessing in natural language processing
- d. A supervised learning algorithm for image classification

Your answer is incorrect.

The correct answer is: A reinforcement learning algorithm for training deep neural networks

Question **8**

Not answered

Marked out of 1.00

What role does experience replay play in NFQ?

- a. It prioritizes recent experiences over older ones.
- b. It directly optimizes the Q-values.
- c. It samples mini-batches of experiences to train the neural network.
- d. It eliminates the need for training on collected experiences.

Your answer is incorrect.

The correct answer is: It samples mini-batches of experiences to train the neural network.

Question **9**

Not answered

Marked out of 1.00

How are the network parameters (weights and biases) of the neural network adjusted during training in NFQ?

- a. They are adjusted to minimize the difference between predicted and target Q-values.
- b. They are adjusted to maximize the Q-values.
- c. They are fixed and not adjusted.
- d. They are adjusted based on the reward received.

Your answer is incorrect.

The correct answer is: They are adjusted to minimize the difference between predicted and target Q-values.

Question **10**

Not answered

Marked out of 1.00

In Neural Fitted Q-Iteration, what role do neural networks play in the learning process?

- a. They approximate the Q-function and improve its accuracy.
- b. They optimize the policy directly.
- c. They determine the exploration strategy of the agent.
- d. They reduce the dimensionality of the state space.

Your answer is incorrect.

The correct answer is: They approximate the Q-function and improve its accuracy.

Question **11**

Not answered

Marked out of 1.00

What are the two critical advantages of using a replay buffer in NFQ experiments?

- a. More iterations and smaller mini-batches
- b. Faster model adaptation and fewer training steps
- c. More diverse mini-batch for updates and avoiding fitting to the same small mini-batch
- d. Increased convergence speed and reduced diversity

Your answer is incorrect.

The correct answer is: More diverse mini-batch for updates and avoiding fitting to the same small mini-batch

Question **12**

Not answered

Marked out of 1.00

In deep reinforcement learning, how can target values be made more stationary to improve convergence?

- a. By employing a different optimization algorithm
- b. By using a dynamic network for target values
- c. By having a separate network called the target network
- d. By adjusting the learning rate of the network

Your answer is incorrect.

The correct answer is: By having a separate network called the target network

Question **13**

Not answered

Marked out of 1.00

What role does the target network serve in DQN?

- a. It stabilizes the training process by providing fixed targets
- b. It determines the learning rate.
- c. It determines the exploration rate during training
- d. It predicts the rewards for each action

Your answer is incorrect.

The correct answer is: It stabilizes the training process by providing fixed targets

Question **14**

Not answered

Marked out of 1.00

How is the target network kept synchronized with the online network in reinforcement learning?

- a. By randomly updating the target network weights
- b. By freezing the target network weights indefinitely
- c. By freezing and frequently updating the weights of the target network
- d. By using a separate optimization algorithm for the target network

Your answer is incorrect.

The correct answer is: By freezing and frequently updating the weights of the target network

Question **15**

Not answered

Marked out of 1.00

Which statement best describes the relationship between the actor and the critic in Actor-Critic methods?

- a. The critic learns to select actions based on the actor's policies
- b. The actor learns to select actions based on the critic's evaluations
- c. Actor-critic methods update the environment
- d. The actor and the critic are independent and do not interact

Your answer is incorrect.

The correct answer is: The actor learns to select actions based on the critic's evaluations

Question **16**

Not answered

Marked out of 1.00

What is the primary responsibility of the "Actor" component in the Actor-Critic method?

- a. Estimating the state-value function
- b. Selecting actions based on a policy function
- c. Parameterizing the value function
- d. Critiquing the actions made by the critic

Your answer is incorrect.

The correct answer is: Selecting actions based on a policy function

Question **17**

Not answered

Marked out of 1.00

What are the two main components of the Actor-Critic method in Reinforcement Learning (RL)?

- a. Supervisor and Learner
- b. Producer and Consumer
- c. Actor and Critic
- d. Actor and Director

Your answer is incorrect.

The correct answer is: Actor and Critic

Question **18**

Not answered

Marked out of 1.00

What characterizes Model-Free RL methods?

- a. They learn a policy or value function directly.
- b. They avoid interactions with the environment.
- c. They simulate and predict future states and rewards.
- d. They explicitly learn a model of the environment.

Your answer is incorrect.

The correct answer is: They learn a policy or value function directly.

Question **19**

Not answered

Marked out of 1.00

In model-based RL, why is planning considered a key component?

- a. It avoids the use of computational resources.
- b. It reduces the need for a model of the environment.
- c. It allows the agent to learn from actual experience.
- d. It helps the agent make more informed decisions by simulating future scenarios.

Your answer is incorrect.

The correct answer is: It helps the agent make more informed decisions by simulating future scenarios.

Question **20**

Not answered

Marked out of 1.00

In Model-Based RL, what is the primary goal of the agent?

- a. To explicitly learn a model of the environment
- b. To learn a policy or value function directly
- c. To interact with the environment without learning
- d. To optimize the agent's architecture

Your answer is incorrect.

The correct answer is: To explicitly learn a model of the environment

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 11:35 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:35 AM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What does "dimensionality" refer to in the context of state spaces?

- a. The number of variables that comprise a single state.
- b. The number of dimensions in the physical environment.
- c. The size of the action space.
- d. The color channels in an image-based state representation.

Your answer is incorrect.

The correct answer is: The number of variables that comprise a single state.

Question **2**

Not answered

Marked out of 1.00

Which statement accurately describes the role of target networks in addressing instability and divergence in function approximation?

- a. Target networks introduce additional exploration in the learning process.
- b. Target networks increase correlation in Q-value updates.
- c. Target networks provide a fixed Q-value target, stabilizing the training process.
- d. Target networks eliminate the need for experience replay.

Your answer is incorrect.

The correct answer is: Target networks provide a fixed Q-value target, stabilizing the training process.

Question **3**

Not answered

Marked out of 1.00

What is the main characteristic of Policy Gradient Methods in reinforcement learning?

- a. They reduce variance in the actor's policy gradient updates.
- b. They maintain both a policy function and a value function.
- c. They directly parameterize the policy and update the policy parameters.
- d. They use deep neural networks for function approximation.

Your answer is incorrect.

The correct answer is: They directly parameterize the policy and update the policy parameters.

Question **4**

Not answered

Marked out of 1.00

Which RL algorithm, when combined with function approximation, involves maintaining both a policy function (actor) and a value function (critic)?

- a. Actor-Critic Methods
- b. SARSA
- c. Policy Gradient Methods
- d. Q-learning

Your answer is incorrect.

The correct answer is: Actor-Critic Methods

Question **5**

Not answered

Marked out of 1.00

What is a potential drawback of using function approximation in reinforcement learning?

- a. Reduced computational complexity
- b. Risk of approximation errors
- c. Improved convergence speed
- d. Increased interpretability

Your answer is incorrect.

The correct answer is: Risk of approximation errors

Question **6**

Not answered

Marked out of 1.00

What are the key assumptions for gradient descent to be a stable optimization method?

- a. Targets must be non-stationary.
- b. Data must be independent and identically distributed (IID).
- c. Data must be dependent and identically distributed (DID).
- d. Targets must be dynamic.

Your answer is incorrect.

The correct answer is: Data must be independent and identically distributed (IID).

Question **7**

Not answered

Marked out of 1.00

What are the core targets used for estimating the action-value function of a policy in the context of NFQ implementation?

- a. Monte Carlo target and lambda target
- b. Temporal-difference target and n-step target
- c. SARSA target and temporal-difference target
- d. SARSA target and Q-learning target

Your answer is incorrect.

The correct answer is: Temporal-difference target and n-step target

Question **8**

Not answered

Marked out of 1.00

What role does experience replay play in NFQ?

- a. It eliminates the need for training on collected experiences.
- b. It samples mini-batches of experiences to train the neural network.
- c. It directly optimizes the Q-values.
- d. It prioritizes recent experiences over older ones.

Your answer is incorrect.

The correct answer is: It samples mini-batches of experiences to train the neural network.

Question **9**

Not answered

Marked out of 1.00

How does NFQ compute the target Q-value for each experience in the mini-batch?

- a. It considers the discounted maximum Q-value of the next state.
- b. It uses the reward and the discounted maximum Q-value of the next state.
- c. It uses the reward only.
- d. It considers the average Q-value of the next state.

Your answer is incorrect.

The correct answer is: It uses the reward and the discounted maximum Q-value of the next state.

Question **10**

Not answered

Marked out of 1.00

What is Neural Fitted Q Iteration (NFQ)?

- a. A reinforcement learning algorithm for training deep neural networks
- b. A supervised learning algorithm for image classification
- c. A technique for data preprocessing in natural language processing
- d. Employs genetic algorithms for optimization

Your answer is incorrect.

The correct answer is: A reinforcement learning algorithm for training deep neural networks

Question **11**

Not answered

Marked out of 1.00

What is the purpose of the replay buffer in experience replay?

- a. To sample mini-batches from a broad set of past experiences
- b. To increase the size of each mini-batch
- c. To speed up the training process
- d. To hold the entire dataset

Your answer is incorrect.

The correct answer is: To sample mini-batches from a broad set of past experiences

Question **12**

Not answered

Marked out of 1.00

What are the two critical advantages of using a replay buffer in NFQ experiments?

- a. Increased convergence speed and reduced diversity
- b. Faster model adaptation and fewer training steps
- c. More iterations and smaller mini-batches
- d. More diverse mini-batch for updates and avoiding fitting to the same small mini-batch

Your answer is incorrect.

The correct answer is: More diverse mini-batch for updates and avoiding fitting to the same small mini-batch

Question **13**

Not answered

Marked out of 1.00

What is the purpose of the target network in the context of DQN (Deep Q-Network)?

- a. To provide additional input to the main network
- b. To improve the non-linear function approximation of the main network
- c. To fix targets and mitigate the issue of "chasing your own tail"
- d. To create dynamic targets for the agent

Your answer is incorrect.

The correct answer is: To fix targets and mitigate the issue of "chasing your own tail"

Question **14**

Not answered

Marked out of 1.00

In deep reinforcement learning, how can target values be made more stationary to improve convergence?

- a. By using a dynamic network for target values
- b. By having a separate network called the target network
- c. By adjusting the learning rate of the network
- d. By employing a different optimization algorithm

Your answer is incorrect.

The correct answer is: By having a separate network called the target network

Question **15**

Not answered

Marked out of 1.00

Which statement best describes the relationship between the actor and the critic in Actor-Critic methods?

- a. The actor and the critic are independent and do not interact
- b. Actor-critic methods update the environment
- c. The actor learns to select actions based on the critic's evaluations
- d. The critic learns to select actions based on the actor's policies

Your answer is incorrect.

The correct answer is: The actor learns to select actions based on the critic's evaluations

Question **16**

Not answered

Marked out of 1.00

What is the primary responsibility of the "Actor" component in the Actor-Critic method?

- a. Selecting actions based on a policy function
- b. Critiquing the actions made by the critic
- c. Estimating the state-value function
- d. Parameterizing the value function

Your answer is incorrect.

The correct answer is: Selecting actions based on a policy function

Question **17**

Not answered

Marked out of 1.00

What does the "Actor Update" phase rely on in the Actor-Critic method?

- a. The actor's selected actions.
- b. The reward from the environment.
- c. The critic's value function.
- d. The state-action pairs.

Your answer is incorrect.

The correct answer is: The critic's value function.

Question **18**

Not answered

Marked out of 1.00

What does "planning" refer to in the context of Reinforcement Learning (RL)?

- a. The simulation of different actions and prediction of their outcomes
- b. The adjustment of the agent's architecture
- c. The execution of predefined actions
- d. The process of making decisions based on historical data

Your answer is incorrect.

The correct answer is: The simulation of different actions and prediction of their outcomes

Question **19**

Not answered

Marked out of 1.00

How does planning in model-based RL differ from model-free RL?

- a. Planning is equally important in both model-based and model-free RL.
- b. Model-free RL is computationally intensive, while model-based RL is less resource-intensive.
- c. Model-based RL uses simulations, while model-free RL relies on actual experience.
- d. Model-free RL involves predefined actions, while model-based RL uses simulations.

Your answer is incorrect.

The correct answer is: Model-based RL uses simulations, while model-free RL relies on actual experience.

Question **20**

Not answered

Marked out of 1.00

What is the primary characteristic of techniques like value iteration and policy iteration in RL?

- a. They extend the ideas of AlphaZero to unknown environments.
- b. They are model-free and involve direct learning from experience.
- c. They focus on continuous control with a probabilistic model.
- d. They are model-based and require planning.

Your answer is incorrect.

The correct answer is: They are model-based and require planning.

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 11:36 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:36 AM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

Which type of function approximation utilizes a simple approach where the value function is represented as a weighted sum of features extracted from the state or state-action pair?

- a. Deep Q-networks
- b. Linear Function Approximation
- c. Polynomial Function Approximation
- d. Non-linear Function Approximation

Your answer is incorrect.

The correct answer is: Linear Function Approximation

Question **2**

Not answered

Marked out of 1.00

What is the purpose of adjusting weights during learning in linear function approximation?

- a. To minimize the error in the exploration strategy.
- b. To minimize the error in the value function prediction.
- c. To ensure a more accurate representation of the environment.
- d. To optimize the policy directly.

Your answer is incorrect.

The correct answer is: To minimize the error in the value function prediction.

Question **3**

Not answered

Marked out of 1.00

What issue may arise when combining function approximation methods, especially non-linear approximators like neural networks, with off-policy learning methods such as Q-learning?

- a. Enhanced exploration strategy
- b. Instability and divergence
- c. Reduced computational complexity
- d. Improved stability in learning

Your answer is incorrect.

The correct answer is: Instability and divergence

Question **4**

Not answered

Marked out of 1.00

Which RL algorithm, when combined with function approximation, involves maintaining both a policy function (actor) and a value function (critic)?

- a. SARSA
- b. Policy Gradient Methods
- c. Q-learning
- d. Actor-Critic Methods

Your answer is incorrect.

The correct answer is: Actor-Critic Methods

Question **5**

Not answered

Marked out of 1.00

Which technique is commonly used in reinforcement learning to approximate the value functions in situations where the state or action space is too large?

- a. Q-Learning
- b. Policy Iteration
- c. Function Approximation
- d. Monte Carlo Methods

Your answer is incorrect.

The correct answer is: Function Approximation

Question **6**

Not answered

Marked out of 1.00

What is the primary advantage of using Neural Fitted Q-Iteration over traditional Q-learning methods?

- a. Better handling of large state spaces
- b. Improved exploration strategy
- c. Faster convergence to the optimal policy
- d. Reduced computational complexity

Your answer is incorrect.

The correct answer is: Better handling of large state spaces

Question **7**

Not answered

Marked out of 1.00

Which loss function does NFQ typically use to measure the discrepancy between predicted Q-values and target Q-values?

- a. Cross-Entropy Loss
- b. Mean Absolute Error (MAE) Loss
- c. Mean Squared Error (MSE) Loss
- d. Huber Loss

Your answer is incorrect.

The correct answer is: Mean Squared Error (MSE) Loss

Question **8**

Not answered

Marked out of 1.00

What distinguishes the on-policy version of the TD target from the off-policy version?

- a. The choice between SARSA target and Q-learning target
- b. The way the action-value function is estimated
- c. The use of n-step target
- d. The use of lambda target

Your answer is incorrect.

The correct answer is: The choice between SARSA target and Q-learning target

Question **9**

Not answered

Marked out of 1.00

What is Neural Fitted Q-Iteration (NFQ) primarily designed for in reinforcement learning?

- a. Function approximation
- b. Monte Carlo simulation
- c. Policy optimization
- d. Feature selection

Your answer is incorrect.

The correct answer is: Function approximation

Question **10**

Not answered

Marked out of 1.00

Which type of neural network architecture is commonly used in Neural Fitted Q Iteration?

- a. Long Short-Term Memory (LSTM) networks
- b. Feedforward Neural Networks (FNNs)
- c. Convolutional Neural Networks (CNNs)
- d. Recurrent Neural Networks (RNN)

Your answer is incorrect.

The correct answer is: Feedforward Neural Networks (FNNs)

Question **11**

Not answered

Marked out of 1.00

What technique is suggested to improve the temporal correlation issue in NFQ experiments?

- a. Experience replay
- b. Batch normalization
- c. Gradient descent
- d. Learning rate annealing

Your answer is incorrect.

The correct answer is: Experience replay

Question **12**

Not answered

Marked out of 1.00

How can the non-stationarity issue be mitigated to some extent in reinforcement learning?

- a. By decreasing the update frequency of the target network
- b. By reducing the interaction time with the environment
- c. By using smaller networks
- d. By increasing the size of the neural networks

Your answer is incorrect.

The correct answer is: By increasing the size of the neural networks

Question **13**

Not answered

Marked out of 1.00

What is the purpose of having two instances of neural network weights for the target network and online network?

- a. To increase model complexity
- b. To introduce randomness in the learning process
- c. To improve convergence speed
- d. To mitigate issues related to weight updates

Your answer is incorrect.

The correct answer is: To improve convergence speed

Question **14**

Not answered

Marked out of 1.00

What does the term "frequently" mean in the context of updating the weights of the target network?

- a. After convergence is achieved
- b. Only at the beginning of the training process
- c. Depending on the problem, with a variable frequency
- d. Every step in the learning process

Your answer is incorrect.

The correct answer is: Depending on the problem, with a variable frequency

Question **15**

Not answered

Marked out of 1.00

Why is the critic's feedback important in Actor-Critic methods?

- a. To minimize future rewards
- b. To reduce the variance of policy updates
- c. To parameterize the policy function
- d. To maximize immediate rewards

Your answer is incorrect.

The correct answer is: To reduce the variance of policy updates

Question **16**

Not answered

Marked out of 1.00

What does the actor-critic method aim to maximize during training?

- a. Variance in policy updates
- b. Immediate rewards
- c. The number of iterations per episode
- d. Future rewards

Your answer is incorrect.

The correct answer is: Future rewards

Question **17**

Not answered

Marked out of 1.00

How does the "Critic Update" phase contribute to the Actor-Critic method?

- a. By refining parameters continuously.
- b. By updating the actor's policy.
- c. By selecting actions based on the policy.
- d. By updating its value function based on reward and the new state.

Your answer is incorrect.

The correct answer is: By updating its value function based on reward and the new state.

Question **18**

Not answered

Marked out of 1.00

How does planning in model-based RL differ from model-free RL?

- a. Planning is equally important in both model-based and model-free RL.
- b. Model-free RL is computationally intensive, while model-based RL is less resource-intensive.
- c. Model-based RL uses simulations, while model-free RL relies on actual experience.
- d. Model-free RL involves predefined actions, while model-based RL uses simulations.

Your answer is incorrect.

The correct answer is: Model-based RL uses simulations, while model-free RL relies on actual experience.

Question **19**

Not answered

Marked out of 1.00

What is the primary characteristic of techniques like value iteration and policy iteration in RL?

- a. They are model-based and require planning.
- b. They are model-free and involve direct learning from experience.
- c. They focus on continuous control with a probabilistic model.
- d. They extend the ideas of AlphaZero to unknown environments.

Your answer is incorrect.

The correct answer is: They are model-based and require planning.

Question **20**

Not answered

Marked out of 1.00

What does "planning" refer to in the context of Reinforcement Learning (RL)?

- a. The process of making decisions based on historical data
- b. The execution of predefined actions
- c. The adjustment of the agent's architecture
- d. The simulation of different actions and prediction of their outcomes

Your answer is incorrect.

The correct answer is: The simulation of different actions and prediction of their outcomes

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 11:36 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:36 AM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is a key characteristic of non-linear function approximation techniques such as neural networks in reinforcement learning?

- a. They rely on a weighted sum of features.
- b. They use polynomial representations.
- c. They are primarily based on decision trees.
- d. They capture more complex relationships between state features and values.

Your answer is incorrect.

The correct answer is: They capture more complex relationships between state features and values.

Question **2**

Not answered

Marked out of 1.00

What does "dimensionality" refer to in the context of state spaces?

- a. The size of the action space.
- b. The number of variables that comprise a single state.
- c. The color channels in an image-based state representation.
- d. The number of dimensions in the physical environment.

Your answer is incorrect.

The correct answer is: The number of variables that comprise a single state.

Question **3**

Not answered

Marked out of 1.00

What is the main characteristic of Policy Gradient Methods in reinforcement learning?

- a. They use deep neural networks for function approximation.
- b. They reduce variance in the actor's policy gradient updates.
- c. They directly parameterize the policy and update the policy parameters.
- d. They maintain both a policy function and a value function.

Your answer is incorrect.

The correct answer is: They directly parameterize the policy and update the policy parameters.

Question **4**

Not answered

Marked out of 1.00

Which type of function approximation utilizes a simple approach where the value function is represented as a weighted sum of features extracted from the state or state-action pair?

- a. Non-linear Function Approximation
- b. Polynomial Function Approximation
- c. Deep Q-networks
- d. Linear Function Approximation

Your answer is incorrect.

The correct answer is: Linear Function Approximation

Question **5**

Not answered

Marked out of 1.00

What is the purpose of adjusting weights during learning in linear function approximation?

- a. To minimize the error in the exploration strategy.
- b. To minimize the error in the value function prediction.
- c. To ensure a more accurate representation of the environment.
- d. To optimize the policy directly.

Your answer is incorrect.

The correct answer is: To minimize the error in the value function prediction.

Question **6**

Not answered

Marked out of 1.00

How are the parameters of the separate target network (Θ) updated in NFQ?

- a. They are updated continuously during training.
- b. They are updated based on the rewards received.
- c. They are not updated; they remain fixed throughout training.
- d. They are updated with the current neural network parameters periodically.

Your answer is incorrect.

The correct answer is: They are updated with the current neural network parameters periodically.

Question **7**

Not answered

Marked out of 1.00

Which loss function does NFQ typically use to measure the discrepancy between predicted Q-values and target Q-values?

- a. Mean Absolute Error (MAE) Loss
- b. Huber Loss
- c. Cross-Entropy Loss
- d. Mean Squared Error (MSE) Loss

Your answer is incorrect.

The correct answer is: Mean Squared Error (MSE) Loss

Question **8**

Not answered

Marked out of 1.00

What are the key assumptions for gradient descent to be a stable optimization method?

- a. Targets must be non-stationary.
- b. Data must be dependent and identically distributed (DID).
- c. Targets must be dynamic.
- d. Data must be independent and identically distributed (IID).

Your answer is incorrect.

The correct answer is: Data must be independent and identically distributed (IID).

Question **9**

Not answered

Marked out of 1.00

What role does experience replay play in NFQ?

- a. It prioritizes recent experiences over older ones.
- b. It samples mini-batches of experiences to train the neural network.
- c. It eliminates the need for training on collected experiences.
- d. It directly optimizes the Q-values.

Your answer is incorrect.

The correct answer is: It samples mini-batches of experiences to train the neural network.

Question **10**

Not answered

Marked out of 1.00

What is the primary advantage of using Neural Fitted Q-Iteration over traditional Q-learning methods?

- a. Improved exploration strategy
- b. Better handling of large state spaces
- c. Reduced computational complexity
- d. Faster convergence to the optimal policy

Your answer is incorrect.

The correct answer is: Better handling of large state spaces

Question **11**

Not answered

Marked out of 1.00

What does the term "frequently" mean in the context of updating the weights of the target network?

- a. Depending on the problem, with a variable frequency
- b. Every step in the learning process
- c. Only at the beginning of the training process
- d. After convergence is achieved

Your answer is incorrect.

The correct answer is: Depending on the problem, with a variable frequency

Question **12**

Not answered

Marked out of 1.00

What is the purpose of the replay buffer in experience replay?

- a. To increase the size of each mini-batch
- b. To speed up the training process
- c. To sample mini-batches from a broad set of past experiences
- d. To hold the entire dataset

Your answer is incorrect.

The correct answer is: To sample mini-batches from a broad set of past experiences

Question **13**

Not answered

Marked out of 1.00

What role does the target network serve in DQN?

- a. It determines the exploration rate during training
- b. It stabilizes the training process by providing fixed targets
- c. It determines the learning rate.
- d. It predicts the rewards for each action

Your answer is incorrect.

The correct answer is: It stabilizes the training process by providing fixed targets

Question **14**

Not answered

Marked out of 1.00

What is the purpose of having two instances of neural network weights for the target network and online network?

- a. To improve convergence speed
- b. To increase model complexity
- c. To mitigate issues related to weight updates
- d. To introduce randomness in the learning process

Your answer is incorrect.

The correct answer is: To improve convergence speed

Question **15**

Not answered

Marked out of 1.00

What are the two main components of the Actor-Critic method in Reinforcement Learning (RL)?

- a. Supervisor and Learner
- b. Actor and Director
- c. Actor and Critic
- d. Producer and Consumer

Your answer is incorrect.

The correct answer is: Actor and Critic

Question **16**

Not answered

Marked out of 1.00

How does the "Critic" component contribute to the Actor-Critic method?

- a. By critiquing the actions made by the actor
- b. By estimating the variance of policy updates
- c. By parameterizing the policy function
- d. By selecting actions in a given state

Your answer is incorrect.

The correct answer is: By critiquing the actions made by the actor

Question **17**

Not answered

Marked out of 1.00

In Actor-Critic methods, what is the purpose of using policy gradient methods during the "Actor Update" phase?

- a. To maximize immediate rewards.
- b. To refine parameters continuously.
- c. To reduce the variance of the gradient estimate using the critic's value function.
- d. To increase the variance of gradient estimates.

Your answer is incorrect.

The correct answer is: To reduce the variance of the gradient estimate using the critic's value function.

Question **18**

Not answered

Marked out of 1.00

What characterizes Model-Free RL methods?

- a. They explicitly learn a model of the environment.
- b. They simulate and predict future states and rewards.
- c. They avoid interactions with the environment.
- d. They learn a policy or value function directly.

Your answer is incorrect.

The correct answer is: They learn a policy or value function directly.

Question **19**

Not answered

Marked out of 1.00

In Model-Based RL, what is the primary goal of the agent?

- a. To explicitly learn a model of the environment
- b. To learn a policy or value function directly
- c. To interact with the environment without learning
- d. To optimize the agent's architecture

Your answer is incorrect.

The correct answer is: To explicitly learn a model of the environment

Question **20**

Not answered

Marked out of 1.00

In model-based RL, why is planning considered a key component?

- a. It reduces the need for a model of the environment.
- b. It avoids the use of computational resources.
- c. It helps the agent make more informed decisions by simulating future scenarios.
- d. It allows the agent to learn from actual experience.

Your answer is incorrect.

The correct answer is: It helps the agent make more informed decisions by simulating future scenarios.

Marked out of 1.00

What is the main drawback of using tabular reinforcement learning in complex problems?

- a. Difficulty in defining rewards
- b. Impracticality in handling high-dimensional state spaces
- c. Lack of exploration strategy
- d. Limited computational power

Your answer is incorrect.

The correct answer is: Impracticality in handling high-dimensional state spaces

Question **2**

Not answered

Marked out of 1.00

What is a potential drawback of using function approximation in reinforcement learning?

- a. Improved convergence speed
- b. Increased interpretability
- c. Reduced computational complexity
- d. Risk of approximation errors

Your answer is incorrect.

The correct answer is: Risk of approximation errors

Question **3**

Not answered

Marked out of 1.00

Which statement accurately describes the role of target networks in addressing instability and divergence in function approximation?

- a. Target networks introduce additional exploration in the learning process.
- b. Target networks provide a fixed Q-value target, stabilizing the training process.
- c. Target networks increase correlation in Q-value updates.
- d. Target networks eliminate the need for experience replay.

Your answer is incorrect.

The correct answer is: Target networks provide a fixed Q-value target, stabilizing the training process.

Question **4**

Not answered

Marked out of 1.00

Which technique is commonly used in reinforcement learning to approximate the value functions in situations where the state or action space is too large?

- a. Monte Carlo Methods
- b. Function Approximation
- c. Policy Iteration
- d. Q-Learning

Your answer is incorrect.

The correct answer is: Function Approximation

Question **5**

Not answered

Marked out of 1.00

Which RL algorithm, when combined with function approximation, involves maintaining both a policy function (actor) and a value function (critic)?

- a. Policy Gradient Methods
- b. SARSA
- c. Q-learning
- d. Actor-Critic Methods

Your answer is incorrect.

The correct answer is: Actor-Critic Methods

Question **6**

Not answered

Marked out of 1.00

In Neural Fitted Q-Iteration, what role do neural networks play in the learning process?

- a. They optimize the policy directly.
- b. They approximate the Q-function and improve its accuracy.
- c. They determine the exploration strategy of the agent.
- d. They reduce the dimensionality of the state space.

Your answer is incorrect.

The correct answer is: They approximate the Q-function and improve its accuracy.

Question **7**

Not answered

Marked out of 1.00

What distinguishes the on-policy version of the TD target from the off-policy version?

- a. The choice between SARSA target and Q-learning target
- b. The way the action-value function is estimated
- c. The use of n-step target
- d. The use of lambda target

Your answer is incorrect.

The correct answer is: The choice between SARSA target and Q-learning target

Question **8**

Not answered

Marked out of 1.00

What is Neural Fitted Q-Iteration (NFQ) primarily designed for in reinforcement learning?

- a. Feature selection
- b. Policy optimization
- c. Monte Carlo simulation
- d. Function approximation

Your answer is incorrect.

The correct answer is: Function approximation

Question **9**

Not answered

Marked out of 1.00

How are the parameters of the separate target network (Θ) updated in NFQ?

- a. They are updated continuously during training.
- b. They are updated based on the rewards received.
- c. They are not updated; they remain fixed throughout training.
- d. They are updated with the current neural network parameters periodically.

Your answer is incorrect.

The correct answer is: They are updated with the current neural network parameters periodically.

Question **10**

Not answered

Marked out of 1.00

How does NFQ compute the target Q-value for each experience in the mini-batch?

- a. It uses the reward and the discounted maximum Q-value of the next state.
- b. It considers the average Q-value of the next state.
- c. It considers the discounted maximum Q-value of the next state.
- d. It uses the reward only.

Your answer is incorrect.

The correct answer is: It uses the reward and the discounted maximum Q-value of the next state.

Question **11**

Not answered

Marked out of 1.00

What are the two critical advantages of using a replay buffer in NFQ experiments?

- a. More diverse mini-batch for updates and avoiding fitting to the same small mini-batch
- b. More iterations and smaller mini-batches
- c. Faster model adaptation and fewer training steps
- d. Increased convergence speed and reduced diversity

Your answer is incorrect.

The correct answer is: More diverse mini-batch for updates and avoiding fitting to the same small mini-batch

Question **12**

Not answered

Marked out of 1.00

In deep reinforcement learning, how can target values be made more stationary to improve convergence?

- a. By having a separate network called the target network
- b. By using a dynamic network for target values
- c. By employing a different optimization algorithm
- d. By adjusting the learning rate of the network

Your answer is incorrect.

The correct answer is: By having a separate network called the target network

Question **13**

Not answered

Marked out of 1.00

How can the non-stationarity issue be mitigated to some extent in reinforcement learning?

- a. By increasing the size of the neural networks
- b. By using smaller networks
- c. By decreasing the update frequency of the target network
- d. By reducing the interaction time with the environment

Your answer is incorrect.

The correct answer is: By increasing the size of the neural networks

Question **14**

Not answered

Marked out of 1.00

What technique is suggested to improve the temporal correlation issue in NFQ experiments?

- a. Learning rate annealing
- b. Batch normalization
- c. Gradient descent
- d. Experience replay

Your answer is incorrect.

The correct answer is: Experience replay

Question **15**

Not answered

Marked out of 1.00

Why is the critic's feedback important in Actor-Critic methods?

- a. To minimize future rewards
- b. To parameterize the policy function
- c. To maximize immediate rewards
- d. To reduce the variance of policy updates

Your answer is incorrect.

The correct answer is: To reduce the variance of policy updates

Question **16**

Not answered

Marked out of 1.00

Which statement best describes the relationship between the actor and the critic in Actor-Critic methods?

- a. The critic learns to select actions based on the actor's policies
- b. The actor learns to select actions based on the critic's evaluations
- c. Actor-critic methods update the environment
- d. The actor and the critic are independent and do not interact

Your answer is incorrect.

The correct answer is: The actor learns to select actions based on the critic's evaluations

Question **17**

Not answered

Marked out of 1.00

What is the primary responsibility of the "Actor" component in the Actor-Critic method?

- a. Selecting actions based on a policy function
- b. Estimating the state-value function
- c. Parameterizing the value function
- d. Critiquing the actions made by the critic

Your answer is incorrect.

The correct answer is: Selecting actions based on a policy function

Question **18**

Not answered

Marked out of 1.00

In model-based RL, why is planning considered a key component?

- a. It reduces the need for a model of the environment.
- b. It allows the agent to learn from actual experience.
- c. It avoids the use of computational resources.
- d. It helps the agent make more informed decisions by simulating future scenarios.

Your answer is incorrect.

The correct answer is: It helps the agent make more informed decisions by simulating future scenarios.

Question **19**

Not answered

Marked out of 1.00

What is the primary characteristic of techniques like value iteration and policy iteration in RL?

- a. They are model-free and involve direct learning from experience.
- b. They extend the ideas of AlphaZero to unknown environments.
- c. They are model-based and require planning.
- d. They focus on continuous control with a probabilistic model.

Your answer is incorrect.

The correct answer is: They are model-based and require planning.

Question **20**

Not answered

Marked out of 1.00

In Model-Based RL, what is the primary goal of the agent?

- a. To interact with the environment without learning
- b. To learn a policy or value function directly
- c. To explicitly learn a model of the environment
- d. To optimize the agent's architecture

Your answer is incorrect.

The correct answer is: To explicitly learn a model of the environment

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 11:37 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:38 AM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the main drawback of using tabular reinforcement learning in complex problems?

- a. Difficulty in defining rewards
- b. Limited computational power
- c. Impracticality in handling high-dimensional state spaces
- d. Lack of exploration strategy

Your answer is incorrect.

The correct answer is: Impracticality in handling high-dimensional state spaces

Question **2**

Not answered

Marked out of 1.00

Which statement accurately describes the role of target networks in addressing instability and divergence in function approximation?

- a. Target networks increase correlation in Q-value updates.
- b. Target networks introduce additional exploration in the learning process.
- c. Target networks provide a fixed Q-value target, stabilizing the training process.
- d. Target networks eliminate the need for experience replay.

Your answer is incorrect.

The correct answer is: Target networks provide a fixed Q-value target, stabilizing the training process.

Question **3**

Not answered

Marked out of 1.00

What is a potential drawback of using function approximation in reinforcement learning?

- a. Improved convergence speed
- b. Reduced computational complexity
- c. Increased interpretability
- d. Risk of approximation errors

Your answer is incorrect.

The correct answer is: Risk of approximation errors

Question **4**

Not answered

Marked out of 1.00

What is a key characteristic of non-linear function approximation techniques such as neural networks in reinforcement learning?

- a. They rely on a weighted sum of features.
- b. They capture more complex relationships between state features and values.
- c. They are primarily based on decision trees.
- d. They use polynomial representations.

Your answer is incorrect.

The correct answer is: They capture more complex relationships between state features and values.

Question **5**

Not answered

Marked out of 1.00

What does "dimensionality" refer to in the context of state spaces?

- a. The color channels in an image-based state representation.
- b. The number of dimensions in the physical environment.
- c. The number of variables that comprise a single state.
- d. The size of the action space.

Your answer is incorrect.

The correct answer is: The number of variables that comprise a single state.

Question **6**

Not answered

Marked out of 1.00

What are the core targets used for estimating the action-value function of a policy in the context of NFQ implementation?

- a. SARSA target and temporal-difference target
- b. Temporal-difference target and n-step target
- c. SARSA target and Q-learning target
- d. Monte Carlo target and lambda target

Your answer is incorrect.

The correct answer is: Temporal-difference target and n-step target

Question **7**

Not answered

Marked out of 1.00

What is Neural Fitted Q Iteration (NFQ)?

- a. A technique for data preprocessing in natural language processing
- b. Employs genetic algorithms for optimization
- c. A reinforcement learning algorithm for training deep neural networks
- d. A supervised learning algorithm for image classification

Your answer is incorrect.

The correct answer is: A reinforcement learning algorithm for training deep neural networks

Question **8**

Not answered

Marked out of 1.00

Which type of neural network architecture is commonly used in Neural Fitted Q Iteration?

- a. Recurrent Neural Networks (RNN)
- b. Long Short-Term Memory (LSTM) networks
- c. Convolutional Neural Networks (CNNs)
- d. Feedforward Neural Networks (FNNs)

Your answer is incorrect.

The correct answer is: Feedforward Neural Networks (FNNs)

Question **9**

Not answered

Marked out of 1.00

How are the network parameters (weights and biases) of the neural network adjusted during training in NFQ?

- a. They are adjusted based on the reward received.
- b. They are fixed and not adjusted.
- c. They are adjusted to minimize the difference between predicted and target Q-values.
- d. They are adjusted to maximize the Q-values.

Your answer is incorrect.

The correct answer is: They are adjusted to minimize the difference between predicted and target Q-values.

Question **10**

Not answered

Marked out of 1.00

What is Neural Fitted Q-Iteration (NFQ) primarily designed for in reinforcement learning?

- a. Feature selection
- b. Policy optimization
- c. Monte Carlo simulation
- d. Function approximation

Your answer is incorrect.

The correct answer is: Function approximation

Question **11**

Not answered

Marked out of 1.00

What is the purpose of the target network in the context of DQN (Deep Q-Network)?

- a. To improve the non-linear function approximation of the main network
- b. To fix targets and mitigate the issue of "chasing your own tail"
- c. To provide additional input to the main network
- d. To create dynamic targets for the agent

Your answer is incorrect.

The correct answer is: To fix targets and mitigate the issue of "chasing your own tail"

Question **12**

Not answered

Marked out of 1.00

How is the target network kept synchronized with the online network in reinforcement learning?

- a. By randomly updating the target network weights
- b. By using a separate optimization algorithm for the target network
- c. By freezing and frequently updating the weights of the target network
- d. By freezing the target network weights indefinitely

Your answer is incorrect.

The correct answer is: By freezing and frequently updating the weights of the target network

Question **13**

Not answered

Marked out of 1.00

How can the non-stationarity issue be mitigated to some extent in reinforcement learning?

- a. By reducing the interaction time with the environment
- b. By using smaller networks
- c. By increasing the size of the neural networks
- d. By decreasing the update frequency of the target network

Your answer is incorrect.

The correct answer is: By increasing the size of the neural networks

Question **14**

Not answered

Marked out of 1.00

What technique is suggested to improve the temporal correlation issue in NFQ experiments?

- a. Batch normalization
- b. Gradient descent
- c. Experience replay
- d. Learning rate annealing

Your answer is incorrect.

The correct answer is: Experience replay

Question **15**

Not answered

Marked out of 1.00

How does the "Critic Update" phase contribute to the Actor-Critic method?

- a. By refining parameters continuously.
- b. By updating its value function based on reward and the new state.
- c. By selecting actions based on the policy.
- d. By updating the actor's policy.

Your answer is incorrect.

The correct answer is: By updating its value function based on reward and the new state.

Question **16**

Not answered

Marked out of 1.00

What does the "Actor Update" phase rely on in the Actor-Critic method?

- a. The state-action pairs.
- b. The reward from the environment.
- c. The actor's selected actions.
- d. The critic's value function.

Your answer is incorrect.

The correct answer is: The critic's value function.

Question **17**

Not answered

Marked out of 1.00

What does the actor-critic method aim to maximize during training?

- a. The number of iterations per episode
- b. Variance in policy updates
- c. Future rewards
- d. Immediate rewards

Your answer is incorrect.

The correct answer is: Future rewards

Question **18**

Not answered

Marked out of 1.00

What does "planning" refer to in the context of Reinforcement Learning (RL)?

- a. The process of making decisions based on historical data
- b. The simulation of different actions and prediction of their outcomes
- c. The execution of predefined actions
- d. The adjustment of the agent's architecture

Your answer is incorrect.

The correct answer is: The simulation of different actions and prediction of their outcomes

Question **19**

Not answered

Marked out of 1.00

What characterizes Model-Free RL methods?

- a. They simulate and predict future states and rewards.
- b. They explicitly learn a model of the environment.
- c. They avoid interactions with the environment.
- d. They learn a policy or value function directly.

Your answer is incorrect.

The correct answer is: They learn a policy or value function directly.

Question **20**

Not answered

Marked out of 1.00

How does planning in model-based RL differ from model-free RL?

- a. Model-free RL involves predefined actions, while model-based RL uses simulations.
- b. Model-based RL uses simulations, while model-free RL relies on actual experience.
- c. Planning is equally important in both model-based and model-free RL.
- d. Model-free RL is computationally intensive, while model-based RL is less resource-intensive.

Your answer is incorrect.

The correct answer is: Model-based RL uses simulations, while model-free RL relies on actual experience.

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 11:38 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:38 AM
Time taken	9 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What issue may arise when combining function approximation methods, especially non-linear approximators like neural networks, with off-policy learning methods such as Q-learning?

- a. Instability and divergence
- b. Enhanced exploration strategy
- c. Improved stability in learning
- d. Reduced computational complexity

Your answer is incorrect.

The correct answer is: Instability and divergence

Question **2**

Not answered

Marked out of 1.00

Which type of function approximation utilizes a simple approach where the value function is represented as a weighted sum of features extracted from the state or state-action pair?

- a. Non-linear Function Approximation
- b. Polynomial Function Approximation
- c. Linear Function Approximation
- d. Deep Q-networks

Your answer is incorrect.

The correct answer is: Linear Function Approximation

Question **3**

Not answered

Marked out of 1.00

What is the purpose of adjusting weights during learning in linear function approximation?

- a. To minimize the error in the exploration strategy.
- b. To minimize the error in the value function prediction.
- c. To ensure a more accurate representation of the environment.
- d. To optimize the policy directly.

Your answer is incorrect.

The correct answer is: To minimize the error in the value function prediction.

Question **4**

Not answered

Marked out of 1.00

What is the main characteristic of Policy Gradient Methods in reinforcement learning?

- a. They maintain both a policy function and a value function.
- b. They directly parameterize the policy and update the policy parameters.
- c. They use deep neural networks for function approximation.
- d. They reduce variance in the actor's policy gradient updates.

Your answer is incorrect.

The correct answer is: They directly parameterize the policy and update the policy parameters.

Question **5**

Not answered

Marked out of 1.00

Which statement accurately describes the role of target networks in addressing instability and divergence in function approximation?

- a. Target networks increase correlation in Q-value updates.
- b. Target networks eliminate the need for experience replay.
- c. Target networks provide a fixed Q-value target, stabilizing the training process.
- d. Target networks introduce additional exploration in the learning process.

Your answer is incorrect.

The correct answer is: Target networks provide a fixed Q-value target, stabilizing the training process.

Question **6**

Not answered

Marked out of 1.00

What are the core targets used for estimating the action-value function of a policy in the context of NFQ implementation?

- a. Monte Carlo target and lambda target
- b. SARSA target and Q-learning target
- c. Temporal-difference target and n-step target
- d. SARSA target and temporal-difference target

Your answer is incorrect.

The correct answer is: Temporal-difference target and n-step target

Question **7**

Not answered

Marked out of 1.00

What are the key assumptions for gradient descent to be a stable optimization method?

- a. Targets must be non-stationary.
- b. Data must be dependent and identically distributed (DID).
- c. Targets must be dynamic.
- d. Data must be independent and identically distributed (IID).

Your answer is incorrect.

The correct answer is: Data must be independent and identically distributed (IID).

Question **8**

Not answered

Marked out of 1.00

How does NFQ compute the target Q-value for each experience in the mini-batch?

- a. It uses the reward only.
- b. It uses the reward and the discounted maximum Q-value of the next state.
- c. It considers the average Q-value of the next state.
- d. It considers the discounted maximum Q-value of the next state.

Your answer is incorrect.

The correct answer is: It uses the reward and the discounted maximum Q-value of the next state.

Question **9**

Not answered

Marked out of 1.00

How are the parameters of the separate target network (Θ) updated in NFQ?

- a. They are updated continuously during training.
- b. They are not updated; they remain fixed throughout training.
- c. They are updated based on the rewards received.
- d. They are updated with the current neural network parameters periodically.

Your answer is incorrect.

The correct answer is: They are updated with the current neural network parameters periodically.

Question **10**

Not answered

Marked out of 1.00

In Neural Fitted Q-Iteration, what role do neural networks play in the learning process?

- a. They determine the exploration strategy of the agent.
- b. They reduce the dimensionality of the state space.
- c. They approximate the Q-function and improve its accuracy.
- d. They optimize the policy directly.

Your answer is incorrect.

The correct answer is: They approximate the Q-function and improve its accuracy.

Question **11**

Not answered

Marked out of 1.00

What is the purpose of having two instances of neural network weights for the target network and online network?

- a. To increase model complexity
- b. To introduce randomness in the learning process
- c. To mitigate issues related to weight updates
- d. To improve convergence speed

Your answer is incorrect.

The correct answer is: To improve convergence speed

Question **12**

Not answered

Marked out of 1.00

What role does the target network serve in DQN?

- a. It predicts the rewards for each action
- b. It determines the learning rate.
- c. It determines the exploration rate during training
- d. It stabilizes the training process by providing fixed targets

Your answer is incorrect.

The correct answer is: It stabilizes the training process by providing fixed targets

Question **13**

Not answered

Marked out of 1.00

What are the two critical advantages of using a replay buffer in NFQ experiments?

- a. More diverse mini-batch for updates and avoiding fitting to the same small mini-batch
- b. Faster model adaptation and fewer training steps
- c. Increased convergence speed and reduced diversity
- d. More iterations and smaller mini-batches

Your answer is incorrect.

The correct answer is: More diverse mini-batch for updates and avoiding fitting to the same small mini-batch

Question **14**

Not answered

Marked out of 1.00

What is the purpose of the replay buffer in experience replay?

- a. To increase the size of each mini-batch
- b. To hold the entire dataset
- c. To sample mini-batches from a broad set of past experiences
- d. To speed up the training process

Your answer is incorrect.

The correct answer is: To sample mini-batches from a broad set of past experiences

Question **15**

Not answered

Marked out of 1.00

How does the "Critic" component contribute to the Actor-Critic method?

- a. By selecting actions in a given state
- b. By estimating the variance of policy updates
- c. By parameterizing the policy function
- d. By critiquing the actions made by the actor

Your answer is incorrect.

The correct answer is: By critiquing the actions made by the actor

Question **16**

Not answered

Marked out of 1.00

What are the two main components of the Actor-Critic method in Reinforcement Learning (RL)?

- a. Supervisor and Learner
- b. Producer and Consumer
- c. Actor and Director
- d. Actor and Critic

Your answer is incorrect.

The correct answer is: Actor and Critic

Question **17**

Not answered

Marked out of 1.00

In Actor-Critic methods, what is the purpose of using policy gradient methods during the "Actor Update" phase?

- a. To increase the variance of gradient estimates.
- b. To maximize immediate rewards.
- c. To reduce the variance of the gradient estimate using the critic's value function.
- d. To refine parameters continuously.

Your answer is incorrect.

The correct answer is: To reduce the variance of the gradient estimate using the critic's value function.

Question **18**

Not answered

Marked out of 1.00

In Model-Based RL, what is the primary goal of the agent?

- a. To interact with the environment without learning
- b. To optimize the agent's architecture
- c. To learn a policy or value function directly
- d. To explicitly learn a model of the environment

Your answer is incorrect.

The correct answer is: To explicitly learn a model of the environment

Question **19**

Not answered

Marked out of 1.00

What is the primary characteristic of techniques like value iteration and policy iteration in RL?

- a. They focus on continuous control with a probabilistic model.
- b. They are model-based and require planning.
- c. They extend the ideas of AlphaZero to unknown environments.
- d. They are model-free and involve direct learning from experience.

Your answer is incorrect.

The correct answer is: They are model-based and require planning.

Question **20**

Not answered

Marked out of 1.00

How does planning in model-based RL differ from model-free RL?

- a. Model-based RL uses simulations, while model-free RL relies on actual experience.
- b. Planning is equally important in both model-based and model-free RL.
- c. Model-free RL involves predefined actions, while model-based RL uses simulations.
- d. Model-free RL is computationally intensive, while model-based RL is less resource-intensive.

Your answer is incorrect.

The correct answer is: Model-based RL uses simulations, while model-free RL relies on actual experience.

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 11:38 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 11:39 AM
Time taken	9 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

Which RL algorithm, when combined with function approximation, involves maintaining both a policy function (actor) and a value function (critic)?

- a. SARSA
- b. Policy Gradient Methods
- c. Q-learning
- d. Actor-Critic Methods

Your answer is incorrect.

The correct answer is: Actor-Critic Methods

Question **2**

Not answered

Marked out of 1.00

Which type of function approximation utilizes a simple approach where the value function is represented as a weighted sum of features extracted from the state or state-action pair?

- a. Deep Q-networks
- b. Linear Function Approximation
- c. Non-linear Function Approximation
- d. Polynomial Function Approximation

Your answer is incorrect.

The correct answer is: Linear Function Approximation

Question **3**

Not answered

Marked out of 1.00

What is a potential drawback of using function approximation in reinforcement learning?

- a. Improved convergence speed
- b. Risk of approximation errors
- c. Reduced computational complexity
- d. Increased interpretability

Your answer is incorrect.

The correct answer is: Risk of approximation errors

Question **4**

Not answered

Marked out of 1.00

What is the main drawback of using tabular reinforcement learning in complex problems?

- a. Impracticality in handling high-dimensional state spaces
- b. Lack of exploration strategy
- c. Difficulty in defining rewards
- d. Limited computational power

Your answer is incorrect.

The correct answer is: Impracticality in handling high-dimensional state spaces

Question **5**

Not answered

Marked out of 1.00

Which technique is commonly used in reinforcement learning to approximate the value functions in situations where the state or action space is too large?

- a. Policy Iteration
- b. Function Approximation
- c. Q-Learning
- d. Monte Carlo Methods

Your answer is incorrect.

The correct answer is: Function Approximation

Question **6**

Not answered

Marked out of 1.00

What role does experience replay play in NFQ?

- a. It eliminates the need for training on collected experiences.
- b. It directly optimizes the Q-values.
- c. It prioritizes recent experiences over older ones.
- d. It samples mini-batches of experiences to train the neural network.

Your answer is incorrect.

The correct answer is: It samples mini-batches of experiences to train the neural network.

Question **7**

Not answered

Marked out of 1.00

What is Neural Fitted Q Iteration (NFQ)?

- a. Employs genetic algorithms for optimization
- b. A reinforcement learning algorithm for training deep neural networks
- c. A supervised learning algorithm for image classification
- d. A technique for data preprocessing in natural language processing

Your answer is incorrect.

The correct answer is: A reinforcement learning algorithm for training deep neural networks

Question **8**

Not answered

Marked out of 1.00

What is the primary advantage of using Neural Fitted Q-Iteration over traditional Q-learning methods?

- a. Reduced computational complexity
- b. Faster convergence to the optimal policy
- c. Better handling of large state spaces
- d. Improved exploration strategy

Your answer is incorrect.

The correct answer is: Better handling of large state spaces

Question **9**

Not answered

Marked out of 1.00

What distinguishes the on-policy version of the TD target from the off-policy version?

- a. The choice between SARSA target and Q-learning target
- b. The use of lambda target
- c. The way the action-value function is estimated
- d. The use of n-step target

Your answer is incorrect.

The correct answer is: The choice between SARSA target and Q-learning target

Question **10**

Not answered

Marked out of 1.00

How are the network parameters (weights and biases) of the neural network adjusted during training in NFQ?

- a. They are adjusted to maximize the Q-values.
- b. They are adjusted based on the reward received.
- c. They are fixed and not adjusted.
- d. They are adjusted to minimize the difference between predicted and target Q-values.

Your answer is incorrect.

The correct answer is: They are adjusted to minimize the difference between predicted and target Q-values.

Question **11**

Not answered

Marked out of 1.00

What is the purpose of the target network in the context of DQN (Deep Q-Network)?

- a. To fix targets and mitigate the issue of "chasing your own tail"
- b. To improve the non-linear function approximation of the main network
- c. To create dynamic targets for the agent
- d. To provide additional input to the main network

Your answer is incorrect.

The correct answer is: To fix targets and mitigate the issue of "chasing your own tail"

Question **12**

Not answered

Marked out of 1.00

What does the term "frequently" mean in the context of updating the weights of the target network?

- a. Every step in the learning process
- b. Depending on the problem, with a variable frequency
- c. After convergence is achieved
- d. Only at the beginning of the training process

Your answer is incorrect.

The correct answer is: Depending on the problem, with a variable frequency

Question **13**

Not answered

Marked out of 1.00

In deep reinforcement learning, how can target values be made more stationary to improve convergence?

- a. By adjusting the learning rate of the network
- b. By employing a different optimization algorithm
- c. By using a dynamic network for target values
- d. By having a separate network called the target network

Your answer is incorrect.

The correct answer is: By having a separate network called the target network

Question **14**

Not answered

Marked out of 1.00

How is the target network kept synchronized with the online network in reinforcement learning?

- a. By freezing and frequently updating the weights of the target network
- b. By randomly updating the target network weights
- c. By freezing the target network weights indefinitely
- d. By using a separate optimization algorithm for the target network

Your answer is incorrect.

The correct answer is: By freezing and frequently updating the weights of the target network

Question **15**

Not answered

Marked out of 1.00

What is the primary responsibility of the "Actor" component in the Actor-Critic method?

- a. Critiquing the actions made by the critic
- b. Selecting actions based on a policy function
- c. Parameterizing the value function
- d. Estimating the state-value function

Your answer is incorrect.

The correct answer is: Selecting actions based on a policy function

Question **16**

Not answered

Marked out of 1.00

In Actor-Critic methods, what is the purpose of using policy gradient methods during the "Actor Update" phase?

- a. To maximize immediate rewards.
- b. To refine parameters continuously.
- c. To reduce the variance of the gradient estimate using the critic's value function.
- d. To increase the variance of gradient estimates.

Your answer is incorrect.

The correct answer is: To reduce the variance of the gradient estimate using the critic's value function.

Question **17**

Not answered

Marked out of 1.00

What does the "Actor Update" phase rely on in the Actor-Critic method?

- a. The critic's value function.
- b. The reward from the environment.
- c. The actor's selected actions.
- d. The state-action pairs.

Your answer is incorrect.

The correct answer is: The critic's value function.

Question **18**

Not answered

Marked out of 1.00

What does "planning" refer to in the context of Reinforcement Learning (RL)?

- a. The adjustment of the agent's architecture
- b. The process of making decisions based on historical data
- c. The simulation of different actions and prediction of their outcomes
- d. The execution of predefined actions

Your answer is incorrect.

The correct answer is: The simulation of different actions and prediction of their outcomes

Question **19**

Not answered

Marked out of 1.00

In model-based RL, why is planning considered a key component?

- a. It avoids the use of computational resources.
- b. It reduces the need for a model of the environment.
- c. It helps the agent make more informed decisions by simulating future scenarios.
- d. It allows the agent to learn from actual experience.

Your answer is incorrect.

The correct answer is: It helps the agent make more informed decisions by simulating future scenarios.

Question **20**

Not answered

Marked out of 1.00

What characterizes Model-Free RL methods?

- a. They explicitly learn a model of the environment.
- b. They simulate and predict future states and rewards.
- c. They learn a policy or value function directly.
- d. They avoid interactions with the environment.

Your answer is incorrect.

The correct answer is: They learn a policy or value function directly.

Unit-V Questions ►

Started on	Tuesday, 5 November 2024, 8:55 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:55 AM
Time taken	8 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What is the primary input to an Automatic Speech Recognition system?

- a. Phonetics
- b. Spoken language
- c. Text transcripts
- d. Written documents

The correct answer is: Spoken language

Question **2**
Not answered
Marked out of 1.00

Which semantic role typically involves the action or state described by the verb in a sentence?

- a. Agent
- b. Theme
- c. Experiencer
- d. Location

The correct answer is: Agent

Question **3**
Not answered
Marked out of 1.00

What does pragmatic analysis in NLP focus on?

- a. Word meanings
- b. Discourse coherence and context
- c. Syntactic structures
- d. Sentence structure

The correct answer is: Discourse coherence and context

Question **4**

Not answered

Marked out of 1.00

What is the purpose of semantic role labeling in NLP?

- a. Analyzing word sounds
- b. Assigning parts of speech to words
- c. Identifying the syntactic structure of a sentence
- d. Assigning roles to words in relation to the verb

The correct answer is: Assigning roles to words in relation to the verb

Question **5**

Not answered

Marked out of 1.00

What is a key advantage of Neural Machine Translation (NMT) over Statistical Machine Translation (SMT)?

- a. Reliance on linguistic rules
- b. Superior performance in small datasets
- c. Simplicity in implementation
- d. Ability to handle long-range dependencies

The correct answer is: Ability to handle long-range dependencies

Question **6**

Not answered

Marked out of 1.00

What does Relevance Feedback involve in Information Retrieval?

- a. Document storage
- b. Obtaining feedback from users on the relevance of retrieved documents
- c. Query formulation
- d. Quick lookups during retrieval

The correct answer is: Obtaining feedback from users on the relevance of retrieved documents

Question **7**

Not answered

Marked out of 1.00

Which level of linguistic analysis involves the study of word formation and structure?

- a. Semantic
- b. Pragmatic
- c. Syntactic
- d. Morphological

The correct answer is: Morphological

Question **8**

Not answered

Marked out of 1.00

Which of the following components is crucial in ASR for dealing with variations in pronunciation and accents?

- a. Acoustic model
- b. Lexicon
- c. Speaker normalization
- d. Language model

The correct answer is: Lexicon

Question **9**

Not answered

Marked out of 1.00

What is a query in the context of Information Retrieval?

- a. A data structure
- b. A unit of information
- c. A formal expression of a user's information need
- d. An index structure

The correct answer is: A formal expression of a user's information need

Question **10**

Not answered

Marked out of 1.00

What does a deep parser aim to capture during linguistic analysis?

- a. Word sounds
- b. Discourse coherence
- c. Morphological features
- d. Sentence structure and meaning

The correct answer is: Sentence structure and meaning

Question **11**

Not answered

Marked out of 1.00

In the context of ASR, what is the purpose of beam search during decoding?

- a. Adapting the system to different languages
- b. Adjusting the model for variations in pronunciation
- c. Enhancing acoustic features
- d. Selecting the most likely transcription from multiple possibilities

The correct answer is: Selecting the most likely transcription from multiple possibilities

Question **12**

Not answered

Marked out of 1.00

What does semantic parsing involve in NLP?

- a. Analyzing word sounds
- b. Understanding the meaning of a sentence in a formal representation
- c. Analyzing word meanings
- d. Identifying syntactic structures

The correct answer is: Understanding the meaning of a sentence in a formal representation

Question **13**

Not answered

Marked out of 1.00

What is Automatic Speech Recognition (ASR) in the context of natural language processing?

- a. Converting written text to spoken words
- b. Transcribing spoken language into written text
- c. Analyzing the tonality of speech
- d. Generating synthetic speech

The correct answer is: Transcribing spoken language into written text

Question **14**

Not answered

Marked out of 1.00

In syntactic analysis, what is a parse tree used to represent?

- a. Sentence structure
- b. Semantic roles
- c. Morphological features
- d. Word meanings

The correct answer is: Sentence structure

Question **15**

Not answered

Marked out of 1.00

In pragmatic analysis, what is the study of how language users convey meaning indirectly?

- a. Politeness strategies
- b. Referring expressions
- c. Discourse coherence
- d. Deixis

The correct answer is: Politeness strategies

Question **16**

Not answered

Marked out of 1.00

What is the primary focus of a semantic role labeling system in NLP?

- a. Analyzing word sounds
- b. Identifying syntactic structures
- c. Assigning roles to words in relation to the verb
- d. Assigning parts of speech to words

The correct answer is: Assigning roles to words in relation to the verb

Question **17**

Not answered

Marked out of 1.00

What is the primary focus of discourse analysis in NLP?

- a. Word meanings
- b. Discourse coherence and context
- c. Syntactic structures
- d. Sentence structure

The correct answer is: Discourse coherence and context

Question **18**

Not answered

Marked out of 1.00

What role does the acoustic model play in ASR?

- a. Incorporating contextual information
- b. Modeling the phonetic content of speech
- c. Representing the grammar and language rules
- d. Mapping phonemes to written characters

The correct answer is: Modeling the phonetic content of speech

Question **19**

Not answered

Marked out of 1.00

What is the purpose of Query Expansion in Information Retrieval?

- a. Reducing query complexity
- b. Creating inverted indices
- c. Improving precision
- d. Expanding the original query with additional terms

The correct answer is: Expanding the original query with additional terms

Question **20**

Not answered

Marked out of 1.00

What does BLEU measure in the context of machine translation evaluation?

- a. Word frequency
- b. Ambiguity in translations
- c. Long-range dependencies
- d. Overlap between machine-generated translations and human references

The correct answer is: Overlap between machine-generated translations and human references

State	Finished
Completed on	Tuesday, 5 November 2024, 8:55 AM
Time taken	9 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

In pragmatic analysis, what does deixis refer to?

- a. Referring expressions
- b. Syntactic structures
- c. Sentence structure
- d. Discourse markers

The correct answer is: Referring expressions

Question **2**
Not answered
Marked out of 1.00

Which evaluation metric measures the relevance of retrieved documents in Information Retrieval?

- a. BLEU
- b. Precision
- c. Recall
- d. F1 Score

The correct answer is: Precision

Question **3**
Not answered
Marked out of 1.00

What is a challenge associated with machine translation for low-resource languages?

- a. Difficulty in handling long-range dependencies
- b. Lack of linguistic rules
- c. Limited availability of training data
- d. Ambiguity in translations

The correct answer is: Limited availability of training data

Question **4**

Not answered

Marked out of 1.00

What does co-reference resolution aim to achieve in NLP?

- a. Resolving references to the same entity in different parts of a text
- b. Assigning parts of speech to words
- c. Identifying syntactic structures
- d. Analyzing word sounds

The correct answer is: Resolving references to the same entity in different parts of a text

Question **5**

Not answered

Marked out of 1.00

What is the purpose of a language model in ASR?

- a. Capturing the likelihood of word sequences
- b. Handling variations in pronunciation
- c. Representing phonetic content
- d. Modeling acoustic features

The correct answer is: Capturing the likelihood of word sequences

Question **6**

Not answered

Marked out of 1.00

Which numerical statistic reflects the importance of a term in a document relative to its importance across a collection of documents?

- a. Inverted Index
- b. Vector Space Model
- c. Boolean Model
- d. Term Frequency-Inverse Document Frequency (TF-IDF)

The correct answer is: Term Frequency-Inverse Document Frequency (TF-IDF)

Question **7**

Not answered

Marked out of 1.00

What is the Vector Space Model used for in Information Retrieval?

- a. Evaluating precision and recall
- b. Representing documents and queries as vectors
- c. Creating inverted indices
- d. Expressing complex queries

The correct answer is: Representing documents and queries as vectors

Question **8**

Not answered

Marked out of 1.00

Which approach to Machine Translation relies on explicit linguistic rules for translation?

- a. Rule-Based Machine Translation (RBMT)
- b. Statistical Machine Translation (SMT)
- c. Deep Learning Translation (DLT)
- d. Neural Machine Translation (NMT)

The correct answer is: Rule-Based Machine Translation (RBMT)

Question **9**

Not answered

Marked out of 1.00

Which term is used to describe the arrangement of words to form well-formed sentences in a language?

- a. Syntax
- b. Pragmatics
- c. Morphology
- d. Semantics

The correct answer is: Syntax

Question **10**

Not answered

Marked out of 1.00

What role does customization play in some machine translation systems?

- a. Handling long-range dependencies
- b. Minimizing model complexity
- c. Applying linguistic rules universally
- d. Adapting translations based on user preferences

The correct answer is: Adapting translations based on user preferences

Question **11**

Not answered

Marked out of 1.00

Which deep learning architecture has shown significant success in ASR tasks, especially with large datasets?

- a. Transformer Models
- b. Decision Trees
- c. Recurrent Neural Networks (RNNs)
- d. Support Vector Machines (SVMs)

The correct answer is: Transformer Models

Question **12**

Not answered

Marked out of 1.00

What is the role of a morphological analyzer in NLP?

- a. Analyzing discourse coherence
- b. Breaking down words into morphemes
- c. Analyzing word meanings
- d. Extracting syntactic structures

The correct answer is: Breaking down words into morphemes

Question **13**

Not answered

Marked out of 1.00

Which evaluation metric is commonly used to assess the performance of ASR systems in terms of word accuracy?

- a. Precision
- b. F1 Score
- c. BLEU
- d. WER (Word Error Rate)

The correct answer is: WER (Word Error Rate)

Question **14**

Not answered

Marked out of 1.00

Which of the following is an example of an inflectional morpheme?

- a. -ed (past tense marker)
- b. -s (plural marker)
- c. -ly (adverb marker)
- d. -ing (progressive marker)

The correct answer is: -ed (past tense marker)

Question **15**

Not answered

Marked out of 1.00

In the sentence "John ate the cake," what is the semantic role of "John"?

- a. Experiencer
- b. Location
- c. Agent
- d. Theme

The correct answer is: Agent

Question **16**

Not answered

Marked out of 1.00

Which neural network architecture has been widely adopted for Neural Machine Translation (NMT)?

- a. Support Vector Machines (SVMs)
- b. Convolutional Neural Networks (CNNs)
- c. Transformer Models
- d. Recurrent Neural Networks (RNNs)

The correct answer is: Transformer Models

Question **17**

Not answered

Marked out of 1.00

In pragmatic analysis, what does the term "implicature" refer to?

- a. Politeness strategies
- b. Discourse markers
- c. Conveying meaning indirectly
- d. Referring expressions

The correct answer is: Conveying meaning indirectly

Question **18**

Not answered

Marked out of 1.00

In syntactic analysis, what is the function of a syntactic tree?

- a. Analyzing word sounds
- b. Analyzing morphological features
- c. Representing sentence structure
- d. Representing word meanings

The correct answer is: Representing sentence structure

Question **19**

Not answered

Marked out of 1.00

What is the primary focus of semantic analysis in NLP?

- a. Morphological features
- b. Sentence structure
- c. Word meanings and relationships
- d. Discourse coherence

The correct answer is: Word meanings and relationships

Question **20**

Not answered

Marked out of 1.00

Which aspect of language involves the study of how context influences the interpretation of language?

- a. Semantics
- b. Morphology
- c. Pragmatics
- d. Syntax

The correct answer is: Pragmatics

State	Finished
Completed on	Tuesday, 5 November 2024, 8:56 AM
Time taken	9 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What does an inverted index facilitate in Information Retrieval?

- a. User feedback
- b. Quick lookups during retrieval
- c. Document storage
- d. Query formulation

The correct answer is: Quick lookups during retrieval

Question **2**
Not answered
Marked out of 1.00

Which of the following is a challenge often faced in ASR, especially in noisy environments?

- a. Acoustic variability
- b. Semantic parsing
- c. Lexical ambiguity
- d. Syntactic analysis

The correct answer is: Acoustic variability

Question **3**
Not answered
Marked out of 1.00

Which linguistic analysis level involves understanding the meaning of individual words and their relationships?

- a. Semantic
- b. Syntactic
- c. Morphological
- d. Pragmatic

The correct answer is: Semantic

Question **4**

Not answered

Marked out of 1.00

What is the primary goal of Machine Translation (MT)?

- a. Developing artificial languages
- b. Teaching machines to understand human emotions
- c. Enabling communication between people who speak different languages
- d. Creating linguistic rules for translation

The correct answer is: Enabling communication between people who speak different languages

Question **5**

Not answered

Marked out of 1.00

What does Latent Semantic Analysis (LSA) aim to analyze in Information Retrieval?

- a. Document storage
- b. Term occurrences
- c. User feedback
- d. Relationships between terms and documents

The correct answer is: Relationships between terms and documents

Question **6**

Not answered

Marked out of 1.00

Which linguistic analysis level involves identifying the grammatical roles of words in a sentence?

- a. Semantic
- b. Pragmatic
- c. Morphological
- d. Syntactic

The correct answer is: Syntactic

Question **7**

Not answered

Marked out of 1.00

In machine translation, what is post-editing?

- a. The process of training neural networks
- b. Selecting the most likely hypothesis in statistical translation
- c. Improving machine-generated translations by human translators
- d. The final step in rule-based translation

The correct answer is: Improving machine-generated translations by human translators

Question **8**

Not answered

Marked out of 1.00

What is the primary goal of Information Retrieval (IR)?

- a. Efficient and effective retrieval of relevant information
- b. Storing large collections of data
- c. Indexing documents
- d. Creating data structures

The correct answer is: Efficient and effective retrieval of relevant information

Question **9**

Not answered

Marked out of 1.00

What model uses Boolean operators (AND, OR, NOT) to express complex queries in Information Retrieval?

- a. Probabilistic Model
- b. Vector Space Model
- c. Boolean Model
- d. Language Model

The correct answer is: Boolean Model

Question **10**

Not answered

Marked out of 1.00

Which analysis level involves understanding the intended meaning of a speaker or writer in a specific context?

- a. Morphological
- b. Syntactic
- c. Semantic
- d. Pragmatic

The correct answer is: Pragmatic

Question **11**

Not answered

Marked out of 1.00

What is speaker adaptation in the context of ASR?

- a. Adapting the system to different languages
- b. Modifying the lexicon for better performance
- c. Adjusting the model for variations in individual speakers' speech patterns
- d. Enhancing the acoustic features of speech

The correct answer is: Adjusting the model for variations in individual speakers' speech patterns

Question **12**

Not answered

Marked out of 1.00

What is the primary goal of an anaphora resolution system in NLP?

- a. Assigning parts of speech to words
- b. Identifying syntactic structures
- c. Resolving references to previously mentioned entities
- d. Analyzing word sounds

The correct answer is: Resolving references to previously mentioned entities

Question **13**

Not answered

Marked out of 1.00

What is the primary goal of discourse markers in NLP?

- a. Indicating relationships between sentences and discourse segments
- b. Identifying syntactic structures
- c. Analyzing word sounds
- d. Assigning parts of speech to words

The correct answer is: Indicating relationships between sentences and discourse segments

Question **14**

Not answered

Marked out of 1.00

Which level of linguistic analysis involves understanding the intended meaning of a speaker or writer in a specific context?

- a. Syntactic
- b. Morphological
- c. Pragmatic
- d. Semantic

The correct answer is: Pragmatic

Question **15**

Not answered

Marked out of 1.00

What does a shallow parser typically focus on during analysis?

- a. Word meanings
- b. Discourse coherence
- c. Syntactic structure
- d. Sentence structure

The correct answer is: Sentence structure

Question **16**

Not answered

Marked out of 1.00

What does morphological analysis in Natural Language Processing primarily focus on?

- a. Sentence structure
- b. Word formation and structure
- c. Semantic relationships
- d. Discourse analysis

The correct answer is: Word formation and structure

Question **17**

Not answered

Marked out of 1.00

In NLP, what is the primary goal of discourse coherence analysis?

- a. Understanding the flow and connectivity of information in a text
- b. Analyzing word sounds
- c. Resolving references to previously mentioned entities
- d. Assigning parts of speech to words

The correct answer is: Understanding the flow and connectivity of information in a text

Question **18**

Not answered

Marked out of 1.00

Which evaluation metric is commonly used to assess the quality of machine translations by comparing them to human reference translations?

- a. Recall
- b. F1 Score
- c. BLEU (Bilingual Evaluation Understudy)
- d. Precision

The correct answer is: BLEU (Bilingual Evaluation Understudy)

Question **19**

Not answered

Marked out of 1.00

What is a challenge often associated with machine translation of idiomatic expressions?

- a. Ambiguity
- b. Lack of linguistic rules
- c. Limited availability of training data
- d. Difficulty in handling long-range dependencies

The correct answer is: Ambiguity

Question **20**

Not answered

Marked out of 1.00

What does syntactic analysis focus on in NLP?

- a. Word meanings
- b. Word formation
- c. Word sounds
- d. Sentence structure and grammar

The correct answer is: Sentence structure and grammar

State	Finished
Completed on	Tuesday, 5 November 2024, 8:56 AM
Time taken	7 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

Which level of linguistic analysis involves the study of word formation and structure?

- a. Semantic
- b. Pragmatic
- c. Morphological
- d. Syntactic

The correct answer is: Morphological

Question **2**
Not answered
Marked out of 1.00

What does Latent Semantic Analysis (LSA) aim to analyze in Information Retrieval?

- a. Term occurrences
- b. User feedback
- c. Relationships between terms and documents
- d. Document storage

The correct answer is: Relationships between terms and documents

Question **3**
Not answered
Marked out of 1.00

What is the purpose of Query Expansion in Information Retrieval?

- a. Improving precision
- b. Creating inverted indices
- c. Reducing query complexity
- d. Expanding the original query with additional terms

The correct answer is: Expanding the original query with additional terms

Question **4**

Not answered

Marked out of 1.00

What is a query in the context of Information Retrieval?

- a. A formal expression of a user's information need
- b. An index structure
- c. A data structure
- d. A unit of information

The correct answer is: A formal expression of a user's information need

Question **5**

Not answered

Marked out of 1.00

What does syntactic analysis focus on in NLP?

- a. Sentence structure and grammar
- b. Word formation
- c. Word sounds
- d. Word meanings

The correct answer is: Sentence structure and grammar

Question **6**

Not answered

Marked out of 1.00

What model uses Boolean operators (AND, OR, NOT) to express complex queries in Information Retrieval?

- a. Vector Space Model
- b. Probabilistic Model
- c. Language Model
- d. Boolean Model

The correct answer is: Boolean Model

Question **7**

Not answered

Marked out of 1.00

What does a deep parser aim to capture during linguistic analysis?

- a. Morphological features
- b. Word sounds
- c. Sentence structure and meaning
- d. Discourse coherence

The correct answer is: Sentence structure and meaning

Question **8**

Not answered

Marked out of 1.00

In NLP, what is the primary goal of discourse coherence analysis?

- a. Assigning parts of speech to words
- b. Resolving references to previously mentioned entities
- c. Understanding the flow and connectivity of information in a text
- d. Analyzing word sounds

The correct answer is: Understanding the flow and connectivity of information in a text

Question **9**

Not answered

Marked out of 1.00

In syntactic analysis, what is the function of a syntactic tree?

- a. Representing sentence structure
- b. Analyzing word sounds
- c. Representing word meanings
- d. Analyzing morphological features

The correct answer is: Representing sentence structure

Question **10**

Not answered

Marked out of 1.00

In pragmatic analysis, what does the term "implicature" refer to?

- a. Referring expressions
- b. Politeness strategies
- c. Discourse markers
- d. Conveying meaning indirectly

The correct answer is: Conveying meaning indirectly

Question **11**

Not answered

Marked out of 1.00

Which evaluation metric is commonly used to assess the quality of machine translations by comparing them to human reference translations?

- a. BLEU (Bilingual Evaluation Understudy)
- b. F1 Score
- c. Precision
- d. Recall

The correct answer is: BLEU (Bilingual Evaluation Understudy)

Question **12**

Not answered

Marked out of 1.00

What is the primary goal of Machine Translation (MT)?

- a. Developing artificial languages
- b. Enabling communication between people who speak different languages
- c. Creating linguistic rules for translation
- d. Teaching machines to understand human emotions

The correct answer is: Enabling communication between people who speak different languages

Question **13**

Not answered

Marked out of 1.00

Which term is used to describe the arrangement of words to form well-formed sentences in a language?

- a. Semantics
- b. Pragmatics
- c. Syntax
- d. Morphology

The correct answer is: Syntax

Question **14**

Not answered

Marked out of 1.00

What role does customization play in some machine translation systems?

- a. Minimizing model complexity
- b. Applying linguistic rules universally
- c. Handling long-range dependencies
- d. Adapting translations based on user preferences

The correct answer is: Adapting translations based on user preferences

Question **15**

Not answered

Marked out of 1.00

Which evaluation metric is commonly used to assess the performance of ASR systems in terms of word accuracy?

- a. Precision
- b. BLEU
- c. WER (Word Error Rate)
- d. F1 Score

The correct answer is: WER (Word Error Rate)

Question **16**

Not answered

Marked out of 1.00

In the context of ASR, what is the purpose of beam search during decoding?

- a. Enhancing acoustic features
- b. Adjusting the model for variations in pronunciation
- c. Adapting the system to different languages
- d. Selecting the most likely transcription from multiple possibilities

The correct answer is: Selecting the most likely transcription from multiple possibilities

Question **17**

Not answered

Marked out of 1.00

Which aspect of language involves the study of how context influences the interpretation of language?

- a. Pragmatics
- b. Semantics
- c. Morphology
- d. Syntax

The correct answer is: Pragmatics

Question **18**

Not answered

Marked out of 1.00

Which linguistic analysis level involves understanding the meaning of individual words and their relationships?

- a. Syntactic
- b. Pragmatic
- c. Morphological
- d. Semantic

The correct answer is: Semantic

Question **19**

Not answered

Marked out of 1.00

What does BLEU measure in the context of machine translation evaluation?

- a. Word frequency
- b. Ambiguity in translations
- c. Long-range dependencies
- d. Overlap between machine-generated translations and human references

The correct answer is: Overlap between machine-generated translations and human references

Question **20**

Not answered

Marked out of 1.00

What is the primary focus of a semantic role labeling system in NLP?

- a. Analyzing word sounds
- b. Identifying syntactic structures
- c. Assigning roles to words in relation to the verb
- d. Assigning parts of speech to words

The correct answer is: Assigning roles to words in relation to the verb

Unit 5- Part B &C ►

Started on	Tuesday, 5 November 2024, 8:56 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:56 AM
Time taken	9 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What does an inverted index facilitate in Information Retrieval?

- a. Quick lookups during retrieval
- b. Document storage
- c. User feedback
- d. Query formulation

The correct answer is: Quick lookups during retrieval

Question **2**
Not answered
Marked out of 1.00

What is a challenge associated with machine translation for low-resource languages?

- a. Difficulty in handling long-range dependencies
- b. Lack of linguistic rules
- c. Ambiguity in translations
- d. Limited availability of training data

The correct answer is: Limited availability of training data

Question **3**
Not answered
Marked out of 1.00

What does Relevance Feedback involve in Information Retrieval?

- a. Obtaining feedback from users on the relevance of retrieved documents
- b. Document storage
- c. Query formulation
- d. Quick lookups during retrieval

The correct answer is: Obtaining feedback from users on the relevance of retrieved documents

Question **4**

Not answered

Marked out of 1.00

What does a shallow parser typically focus on during analysis?

- a. Syntactic structure
- b. Sentence structure
- c. Word meanings
- d. Discourse coherence

The correct answer is: Sentence structure

Question **5**

Not answered

Marked out of 1.00

Which of the following is a challenge often faced in ASR, especially in noisy environments?

- a. Lexical ambiguity
- b. Acoustic variability
- c. Semantic parsing
- d. Syntactic analysis

The correct answer is: Acoustic variability

Question **6**

Not answered

Marked out of 1.00

What does morphological analysis in Natural Language Processing primarily focus on?

- a. Semantic relationships
- b. Sentence structure
- c. Word formation and structure
- d. Discourse analysis

The correct answer is: Word formation and structure

Question **7**

Not answered

Marked out of 1.00

What is the primary goal of discourse markers in NLP?

- a. Assigning parts of speech to words
- b. Indicating relationships between sentences and discourse segments
- c. Identifying syntactic structures
- d. Analyzing word sounds

The correct answer is: Indicating relationships between sentences and discourse segments

Question **8**

Not answered

Marked out of 1.00

Which evaluation metric measures the relevance of retrieved documents in Information Retrieval?

- a. Precision
- b. Recall
- c. F1 Score
- d. BLEU

The correct answer is: Precision

Question **9**

Not answered

Marked out of 1.00

Which level of linguistic analysis involves understanding the intended meaning of a speaker or writer in a specific context?

- a. Semantic
- b. Pragmatic
- c. Syntactic
- d. Morphological

The correct answer is: Pragmatic

Question **10**

Not answered

Marked out of 1.00

What is the primary goal of an anaphora resolution system in NLP?

- a. Identifying syntactic structures
- b. Resolving references to previously mentioned entities
- c. Assigning parts of speech to words
- d. Analyzing word sounds

The correct answer is: Resolving references to previously mentioned entities

Question **11**

Not answered

Marked out of 1.00

Which semantic role typically involves the action or state described by the verb in a sentence?

- a. Location
- b. Experiencer
- c. Agent
- d. Theme

The correct answer is: Agent

Question **12**

Not answered

Marked out of 1.00

In syntactic analysis, what is a parse tree used to represent?

- a. Word meanings
- b. Morphological features
- c. Sentence structure
- d. Semantic roles

The correct answer is: Sentence structure

Question **13**

Not answered

Marked out of 1.00

Which of the following is an example of an inflectional morpheme?

- a. -ly (adverb marker)
- b. -ing (progressive marker)
- c. -ed (past tense marker)
- d. -s (plural marker)

The correct answer is: -ed (past tense marker)

Question **14**

Not answered

Marked out of 1.00

What is the primary focus of discourse analysis in NLP?

- a. Discourse coherence and context
- b. Sentence structure
- c. Word meanings
- d. Syntactic structures

The correct answer is: Discourse coherence and context

Question **15**

Not answered

Marked out of 1.00

In the sentence "John ate the cake," what is the semantic role of "John"?

- a. Location
- b. Experiencer
- c. Theme
- d. Agent

The correct answer is: Agent

Question **16**

Not answered

Marked out of 1.00

Which neural network architecture has been widely adopted for Neural Machine Translation (NMT)?

- a. Support Vector Machines (SVMs)
- b. Convolutional Neural Networks (CNNs)
- c. Transformer Models
- d. Recurrent Neural Networks (RNNs)

The correct answer is: Transformer Models

Question **17**

Not answered

Marked out of 1.00

What does semantic parsing involve in NLP?

- a. Identifying syntactic structures
- b. Analyzing word sounds
- c. Understanding the meaning of a sentence in a formal representation
- d. Analyzing word meanings

The correct answer is: Understanding the meaning of a sentence in a formal representation

Question **18**

Not answered

Marked out of 1.00

What role does the acoustic model play in ASR?

- a. Modeling the phonetic content of speech
- b. Incorporating contextual information
- c. Representing the grammar and language rules
- d. Mapping phonemes to written characters

The correct answer is: Modeling the phonetic content of speech

Question **19**

Not answered

Marked out of 1.00

What is the purpose of a language model in ASR?

- a. Capturing the likelihood of word sequences
- b. Handling variations in pronunciation
- c. Representing phonetic content
- d. Modeling acoustic features

The correct answer is: Capturing the likelihood of word sequences

Question **20**

Not answered

Marked out of 1.00

What is a challenge often associated with machine translation of idiomatic expressions?

- a. Ambiguity
- b. Limited availability of training data
- c. Difficulty in handling long-range dependencies
- d. Lack of linguistic rules

The correct answer is: Ambiguity

Unit 5- Part B &C ►

Started on	Tuesday, 5 November 2024, 8:57 AM
State	Finished
Completed on	Tuesday, 5 November 2024, 8:57 AM
Time taken	8 secs
Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

Which of the following components is crucial in ASR for dealing with variations in pronunciation and accents?

- a. Lexicon
- b. Acoustic model
- c. Language model
- d. Speaker normalization

The correct answer is: Lexicon

Question **2**
Not answered
Marked out of 1.00

What is speaker adaptation in the context of ASR?

- a. Enhancing the acoustic features of speech
- b. Adapting the system to different languages
- c. Modifying the lexicon for better performance
- d. Adjusting the model for variations in individual speakers' speech patterns

The correct answer is: Adjusting the model for variations in individual speakers' speech patterns

Question **3**
Not answered
Marked out of 1.00

What does pragmatic analysis in NLP focus on?

- a. Discourse coherence and context
- b. Word meanings
- c. Sentence structure
- d. Syntactic structures

The correct answer is: Discourse coherence and context

Question **4**

Not answered

Marked out of 1.00

What does co-reference resolution aim to achieve in NLP?

- a. Analyzing word sounds
- b. Assigning parts of speech to words
- c. Resolving references to the same entity in different parts of a text
- d. Identifying syntactic structures

The correct answer is: Resolving references to the same entity in different parts of a text

Question **5**

Not answered

Marked out of 1.00

What is the primary input to an Automatic Speech Recognition system?

- a. Text transcripts
- b. Spoken language
- c. Phonetics
- d. Written documents

The correct answer is: Spoken language

Question **6**

Not answered

Marked out of 1.00

In machine translation, what is post-editing?

- a. The process of training neural networks
- b. The final step in rule-based translation
- c. Improving machine-generated translations by human translators
- d. Selecting the most likely hypothesis in statistical translation

The correct answer is: Improving machine-generated translations by human translators

Question **7**

Not answered

Marked out of 1.00

What is a key advantage of Neural Machine Translation (NMT) over Statistical Machine Translation (SMT)?

- a. Superior performance in small datasets
- b. Ability to handle long-range dependencies
- c. Reliance on linguistic rules
- d. Simplicity in implementation

The correct answer is: Ability to handle long-range dependencies

Question **8**

Not answered

Marked out of 1.00

Which approach to Machine Translation relies on explicit linguistic rules for translation?

- a. Rule-Based Machine Translation (RBMT)
- b. Statistical Machine Translation (SMT)
- c. Neural Machine Translation (NMT)
- d. Deep Learning Translation (DLT)

The correct answer is: Rule-Based Machine Translation (RBMT)

Question **9**

Not answered

Marked out of 1.00

What is the Vector Space Model used for in Information Retrieval?

- a. Creating inverted indices
- b. Evaluating precision and recall
- c. Expressing complex queries
- d. Representing documents and queries as vectors

The correct answer is: Representing documents and queries as vectors

Question **10**

Not answered

Marked out of 1.00

In pragmatic analysis, what is the study of how language users convey meaning indirectly?

- a. Referring expressions
- b. Politeness strategies
- c. Deixis
- d. Discourse coherence

The correct answer is: Politeness strategies

Question **11**

Not answered

Marked out of 1.00

Which numerical statistic reflects the importance of a term in a document relative to its importance across a collection of documents?

- a. Inverted Index
- b. Boolean Model
- c. Term Frequency-Inverse Document Frequency (TF-IDF)
- d. Vector Space Model

The correct answer is: Term Frequency-Inverse Document Frequency (TF-IDF)

Question **12**

Not answered

Marked out of 1.00

What is Automatic Speech Recognition (ASR) in the context of natural language processing?

- a. Generating synthetic speech
- b. Analyzing the tonality of speech
- c. Transcribing spoken language into written text
- d. Converting written text to spoken words

The correct answer is: Transcribing spoken language into written text

Question **13**

Not answered

Marked out of 1.00

In pragmatic analysis, what does deixis refer to?

- a. Discourse markers
- b. Referring expressions
- c. Syntactic structures
- d. Sentence structure

The correct answer is: Referring expressions

Question **14**

Not answered

Marked out of 1.00

Which deep learning architecture has shown significant success in ASR tasks, especially with large datasets?

- a. Support Vector Machines (SVMs)
- b. Recurrent Neural Networks (RNNs)
- c. Transformer Models
- d. Decision Trees

The correct answer is: Transformer Models

Question **15**

Not answered

Marked out of 1.00

What is the primary goal of Information Retrieval (IR)?

- a. Storing large collections of data
- b. Indexing documents
- c. Efficient and effective retrieval of relevant information
- d. Creating data structures

The correct answer is: Efficient and effective retrieval of relevant information

Question **16**

Not answered

Marked out of 1.00

What is the primary focus of semantic analysis in NLP?

- a. Word meanings and relationships
- b. Sentence structure
- c. Discourse coherence
- d. Morphological features

The correct answer is: Word meanings and relationships

Question **17**

Not answered

Marked out of 1.00

Which analysis level involves understanding the intended meaning of a speaker or writer in a specific context?

- a. Syntactic
- b. Morphological
- c. Pragmatic
- d. Semantic

The correct answer is: Pragmatic

Question **18**

Not answered

Marked out of 1.00

What is the role of a morphological analyzer in NLP?

- a. Analyzing word meanings
- b. Extracting syntactic structures
- c. Analyzing discourse coherence
- d. Breaking down words into morphemes

The correct answer is: Breaking down words into morphemes

Question **19**

Not answered

Marked out of 1.00

Which linguistic analysis level involves identifying the grammatical roles of words in a sentence?

- a. Pragmatic
- b. Morphological
- c. Syntactic
- d. Semantic

The correct answer is: Syntactic

Question **20**

Not answered

Marked out of 1.00

What is the purpose of semantic role labeling in NLP?

- a. Analyzing word sounds
- b. Assigning roles to words in relation to the verb
- c. Assigning parts of speech to words
- d. Identifying the syntactic structure of a sentence

The correct answer is: Assigning roles to words in relation to the verb

Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What does morphological analysis in Natural Language Processing primarily focus on?

- a. Discourse analysis
- b. Sentence structure
- c. Word formation and structure
- d. Semantic relationships

The correct answer is: Word formation and structure

Question **2**
Not answered
Marked out of 1.00

Which of the following is an example of an inflectional morpheme?

- a. -ing (progressive marker)
- b. -s (plural marker)
- c. -ed (past tense marker)
- d. -ly (adverb marker)

The correct answer is: -ed (past tense marker)

Question **3**
Not answered
Marked out of 1.00

What does Latent Semantic Analysis (LSA) aim to analyze in Information Retrieval?

- a. Term occurrences
- b. Relationships between terms and documents
- c. User feedback
- d. Document storage

The correct answer is: Relationships between terms and documents

Question **4**

Not answered

Marked out of 1.00

What model uses Boolean operators (AND, OR, NOT) to express complex queries in Information Retrieval?

- a. Boolean Model
- b. Language Model
- c. Probabilistic Model
- d. Vector Space Model

The correct answer is: Boolean Model

Question **5**

Not answered

Marked out of 1.00

In syntactic analysis, what is the function of a syntactic tree?

- a. Representing sentence structure
- b. Analyzing morphological features
- c. Representing word meanings
- d. Analyzing word sounds

The correct answer is: Representing sentence structure

Question **6**

Not answered

Marked out of 1.00

What is the Vector Space Model used for in Information Retrieval?

- a. Expressing complex queries
- b. Representing documents and queries as vectors
- c. Creating inverted indices
- d. Evaluating precision and recall

The correct answer is: Representing documents and queries as vectors

Question **7**

Not answered

Marked out of 1.00

What is the purpose of semantic role labeling in NLP?

- a. Analyzing word sounds
- b. Assigning parts of speech to words
- c. Assigning roles to words in relation to the verb
- d. Identifying the syntactic structure of a sentence

The correct answer is: Assigning roles to words in relation to the verb

Question **8**

Not answered

Marked out of 1.00

What role does the acoustic model play in ASR?

- a. Modeling the phonetic content of speech
- b. Mapping phonemes to written characters
- c. Incorporating contextual information
- d. Representing the grammar and language rules

The correct answer is: Modeling the phonetic content of speech

Question **9**

Not answered

Marked out of 1.00

Which of the following components is crucial in ASR for dealing with variations in pronunciation and accents?

- a. Language model
- b. Acoustic model
- c. Speaker normalization
- d. Lexicon

The correct answer is: Lexicon

Question **10**

Not answered

Marked out of 1.00

What does Relevance Feedback involve in Information Retrieval?

- a. Quick lookups during retrieval
- b. Document storage
- c. Obtaining feedback from users on the relevance of retrieved documents
- d. Query formulation

The correct answer is: Obtaining feedback from users on the relevance of retrieved documents

Question **11**

Not answered

Marked out of 1.00

Which of the following is a challenge often faced in ASR, especially in noisy environments?

- a. Syntactic analysis
- b. Acoustic variability
- c. Semantic parsing
- d. Lexical ambiguity

The correct answer is: Acoustic variability

Question **12**

Not answered

Marked out of 1.00

What is the role of a morphological analyzer in NLP?

- a. Extracting syntactic structures
- b. Analyzing discourse coherence
- c. Breaking down words into morphemes
- d. Analyzing word meanings

The correct answer is: Breaking down words into morphemes

Question **13**

Not answered

Marked out of 1.00

In machine translation, what is post-editing?

- a. The final step in rule-based translation
- b. The process of training neural networks
- c. Selecting the most likely hypothesis in statistical translation
- d. Improving machine-generated translations by human translators

The correct answer is: Improving machine-generated translations by human translators

Question **14**

Not answered

Marked out of 1.00

Which analysis level involves understanding the intended meaning of a speaker or writer in a specific context?

- a. Pragmatic
- b. Semantic
- c. Morphological
- d. Syntactic

The correct answer is: Pragmatic

Question **15**

Not answered

Marked out of 1.00

Which evaluation metric is commonly used to assess the quality of machine translations by comparing them to human reference translations?

- a. Recall
- b. F1 Score
- c. Precision
- d. BLEU (Bilingual Evaluation Understudy)

The correct answer is: BLEU (Bilingual Evaluation Understudy)

Question **16**

Not answered

Marked out of 1.00

What is a key advantage of Neural Machine Translation (NMT) over Statistical Machine Translation (SMT)?

- a. Simplicity in implementation
- b. Reliance on linguistic rules
- c. Ability to handle long-range dependencies
- d. Superior performance in small datasets

The correct answer is: Ability to handle long-range dependencies

Question **17**

Not answered

Marked out of 1.00

What does syntactic analysis focus on in NLP?

- a. Sentence structure and grammar
- b. Word sounds
- c. Word formation
- d. Word meanings

The correct answer is: Sentence structure and grammar

Question **18**

Not answered

Marked out of 1.00

Which level of linguistic analysis involves understanding the intended meaning of a speaker or writer in a specific context?

- a. Morphological
- b. Semantic
- c. Syntactic
- d. Pragmatic

The correct answer is: Pragmatic

Question **19**

Not answered

Marked out of 1.00

What does pragmatic analysis in NLP focus on?

- a. Syntactic structures
- b. Discourse coherence and context
- c. Sentence structure
- d. Word meanings

The correct answer is: Discourse coherence and context

Question **20**

Not answered

Marked out of 1.00

Which deep learning architecture has shown significant success in ASR tasks, especially with large datasets?

- a. Support Vector Machines (SVMs)
- b. Decision Trees
- c. Transformer Models
- d. Recurrent Neural Networks (RNNs)

The correct answer is: Transformer Models

Question **1**
Not answered
Marked out of 1.00

What is the primary goal of Machine Translation (MT)?

- a. Enabling communication between people who speak different languages
- b. Developing artificial languages
- c. Teaching machines to understand human emotions
- d. Creating linguistic rules for translation

The correct answer is: Enabling communication between people who speak different languages

Question **2**
Not answered
Marked out of 1.00

In the sentence "John ate the cake," what is the semantic role of "John"?

- a. Location
- b. Agent
- c. Theme
- d. Experiencer

The correct answer is: Agent

Question **3**
Not answered
Marked out of 1.00

What does co-reference resolution aim to achieve in NLP?

- a. Identifying syntactic structures
- b. Resolving references to the same entity in different parts of a text
- c. Assigning parts of speech to words
- d. Analyzing word sounds

The correct answer is: Resolving references to the same entity in different parts of a text

Question **4**

Not answered

Marked out of 1.00

What is the primary focus of discourse analysis in NLP?

- a. Syntactic structures
- b. Word meanings
- c. Sentence structure
- d. Discourse coherence and context

The correct answer is: Discourse coherence and context

Question **5**

Not answered

Marked out of 1.00

In pragmatic analysis, what does the term "implicature" refer to?

- a. Politeness strategies
- b. Conveying meaning indirectly
- c. Referring expressions
- d. Discourse markers

The correct answer is: Conveying meaning indirectly

Question **6**

Not answered

Marked out of 1.00

In pragmatic analysis, what does deixis refer to?

- a. Discourse markers
- b. Syntactic structures
- c. Sentence structure
- d. Referring expressions

The correct answer is: Referring expressions

Question **7**

Not answered

Marked out of 1.00

What does BLEU measure in the context of machine translation evaluation?

- a. Word frequency
- b. Overlap between machine-generated translations and human references
- c. Long-range dependencies
- d. Ambiguity in translations

The correct answer is: Overlap between machine-generated translations and human references

Question **8**

Not answered

Marked out of 1.00

What does a shallow parser typically focus on during analysis?

- a. Syntactic structure
- b. Word meanings
- c. Sentence structure
- d. Discourse coherence

The correct answer is: Sentence structure

Question **9**

Not answered

Marked out of 1.00

What is the purpose of a language model in ASR?

- a. Capturing the likelihood of word sequences
- b. Modeling acoustic features
- c. Representing phonetic content
- d. Handling variations in pronunciation

The correct answer is: Capturing the likelihood of word sequences

Question **10**

Not answered

Marked out of 1.00

Which neural network architecture has been widely adopted for Neural Machine Translation (NMT)?

- a. Transformer Models
- b. Convolutional Neural Networks (CNNs)
- c. Recurrent Neural Networks (RNNs)
- d. Support Vector Machines (SVMs)

The correct answer is: Transformer Models

Question **11**

Not answered

Marked out of 1.00

What is a query in the context of Information Retrieval?

- a. A data structure
- b. A unit of information
- c. A formal expression of a user's information need
- d. An index structure

The correct answer is: A formal expression of a user's information need

Question **12**

Not answered

Marked out of 1.00

What is a challenge often associated with machine translation of idiomatic expressions?

- a. Limited availability of training data
- b. Difficulty in handling long-range dependencies
- c. Ambiguity
- d. Lack of linguistic rules

The correct answer is: Ambiguity

Question **13**

Not answered

Marked out of 1.00

Which semantic role typically involves the action or state described by the verb in a sentence?

- a. Location
- b. Agent
- c. Experiencer
- d. Theme

The correct answer is: Agent

Question **14**

Not answered

Marked out of 1.00

Which aspect of language involves the study of how context influences the interpretation of language?

- a. Morphology
- b. Pragmatics
- c. Syntax
- d. Semantics

The correct answer is: Pragmatics

Question **15**

Not answered

Marked out of 1.00

What is the primary focus of semantic analysis in NLP?

- a. Word meanings and relationships
- b. Morphological features
- c. Sentence structure
- d. Discourse coherence

The correct answer is: Word meanings and relationships

Question **16**

Not answered

Marked out of 1.00

What is the primary goal of discourse markers in NLP?

- a. Analyzing word sounds
- b. Identifying syntactic structures
- c. Assigning parts of speech to words
- d. Indicating relationships between sentences and discourse segments

The correct answer is: Indicating relationships between sentences and discourse segments

Question **17**

Not answered

Marked out of 1.00

In NLP, what is the primary goal of discourse coherence analysis?

- a. Understanding the flow and connectivity of information in a text
- b. Assigning parts of speech to words
- c. Analyzing word sounds
- d. Resolving references to previously mentioned entities

The correct answer is: Understanding the flow and connectivity of information in a text

Question **18**

Not answered

Marked out of 1.00

Which evaluation metric is commonly used to assess the performance of ASR systems in terms of word accuracy?

- a. BLEU
- b. Precision
- c. WER (Word Error Rate)
- d. F1 Score

The correct answer is: WER (Word Error Rate)

Question **19**

Not answered

Marked out of 1.00

Which evaluation metric measures the relevance of retrieved documents in Information Retrieval?

- a. Recall
- b. BLEU
- c. Precision
- d. F1 Score

The correct answer is: Precision

Question **20**

Not answered

Marked out of 1.00

What is a challenge associated with machine translation for low-resource languages?

- a. Limited availability of training data
- b. Difficulty in handling long-range dependencies
- c. Ambiguity in translations
- d. Lack of linguistic rules

The correct answer is: Limited availability of training data

Grade	**0.00** out of 20.00 (**0**%)

Question **1**
Not answered
Marked out of 1.00

What is the primary focus of a semantic role labeling system in NLP?

- a. Identifying syntactic structures
- b. Assigning roles to words in relation to the verb
- c. Analyzing word sounds
- d. Assigning parts of speech to words

The correct answer is: Assigning roles to words in relation to the verb

Question **2**
Not answered
Marked out of 1.00

In the context of ASR, what is the purpose of beam search during decoding?

- a. Enhancing acoustic features
- b. Adjusting the model for variations in pronunciation
- c. Selecting the most likely transcription from multiple possibilities
- d. Adapting the system to different languages

The correct answer is: Selecting the most likely transcription from multiple possibilities

Question **3**
Not answered
Marked out of 1.00

What does a deep parser aim to capture during linguistic analysis?

- a. Morphological features
- b. Sentence structure and meaning
- c. Word sounds
- d. Discourse coherence

The correct answer is: Sentence structure and meaning

Question **4**

Not answered

Marked out of 1.00

Which numerical statistic reflects the importance of a term in a document relative to its importance across a collection of documents?

- a. Vector Space Model
- b. Boolean Model
- c. Inverted Index
- d. Term Frequency-Inverse Document Frequency (TF-IDF)

The correct answer is: Term Frequency-Inverse Document Frequency (TF-IDF)

Question **5**

Not answered

Marked out of 1.00

In syntactic analysis, what is a parse tree used to represent?

- a. Semantic roles
- b. Word meanings
- c. Sentence structure
- d. Morphological features

The correct answer is: Sentence structure

Question **6**

Not answered

Marked out of 1.00

What role does customization play in some machine translation systems?

- a. Handling long-range dependencies
- b. Minimizing model complexity
- c. Adapting translations based on user preferences
- d. Applying linguistic rules universally

The correct answer is: Adapting translations based on user preferences

Question **7**

Not answered

Marked out of 1.00

What is the primary input to an Automatic Speech Recognition system?

- a. Text transcripts
- b. Written documents
- c. Spoken language
- d. Phonetics

The correct answer is: Spoken language

Question **8**

Not answered

Marked out of 1.00

Which linguistic analysis level involves identifying the grammatical roles of words in a sentence?

- a. Syntactic
- b. Pragmatic
- c. Semantic
- d. Morphological

The correct answer is: Syntactic

Question **9**

Not answered

Marked out of 1.00

Which level of linguistic analysis involves the study of word formation and structure?

- a. Pragmatic
- b. Morphological
- c. Semantic
- d. Syntactic

The correct answer is: Morphological

Question **10**

Not answered

Marked out of 1.00

Which linguistic analysis level involves understanding the meaning of individual words and their relationships?

- a. Syntactic
- b. Morphological
- c. Semantic
- d. Pragmatic

The correct answer is: Semantic

Question **11**

Not answered

Marked out of 1.00

What does semantic parsing involve in NLP?

- a. Understanding the meaning of a sentence in a formal representation
- b. Analyzing word meanings
- c. Identifying syntactic structures
- d. Analyzing word sounds

The correct answer is: Understanding the meaning of a sentence in a formal representation

Question **12**

Not answered

Marked out of 1.00

What does an inverted index facilitate in Information Retrieval?

- a. Query formulation
- b. Document storage
- c. User feedback
- d. Quick lookups during retrieval

The correct answer is: Quick lookups during retrieval

Question **13**

Not answered

Marked out of 1.00

What is the primary goal of Information Retrieval (IR)?

- a. Indexing documents
- b. Efficient and effective retrieval of relevant information
- c. Creating data structures
- d. Storing large collections of data

The correct answer is: Efficient and effective retrieval of relevant information

Question **14**

Not answered

Marked out of 1.00

What is the primary goal of an anaphora resolution system in NLP?

- a. Assigning parts of speech to words
- b. Identifying syntactic structures
- c. Analyzing word sounds
- d. Resolving references to previously mentioned entities

The correct answer is: Resolving references to previously mentioned entities

Question **15**

Not answered

Marked out of 1.00

What is speaker adaptation in the context of ASR?

- a. Adjusting the model for variations in individual speakers' speech patterns
- b. Modifying the lexicon for better performance
- c. Enhancing the acoustic features of speech
- d. Adapting the system to different languages

The correct answer is: Adjusting the model for variations in individual speakers' speech patterns

Question **16**

Not answered

Marked out of 1.00

Which approach to Machine Translation relies on explicit linguistic rules for translation?

- a. Neural Machine Translation (NMT)
- b. Statistical Machine Translation (SMT)
- c. Deep Learning Translation (DLT)
- d. Rule-Based Machine Translation (RBMT)

The correct answer is: Rule-Based Machine Translation (RBMT)

Question **17**

Not answered

Marked out of 1.00

What is the purpose of Query Expansion in Information Retrieval?

- a. Creating inverted indices
- b. Reducing query complexity
- c. Expanding the original query with additional terms
- d. Improving precision

The correct answer is: Expanding the original query with additional terms

Question **18**

Not answered

Marked out of 1.00

Which term is used to describe the arrangement of words to form well-formed sentences in a language?

- a. Morphology
- b. Pragmatics
- c. Semantics
- d. Syntax

The correct answer is: Syntax

Question **19**

Not answered

Marked out of 1.00

In pragmatic analysis, what is the study of how language users convey meaning indirectly?

- a. Referring expressions
- b. Discourse coherence
- c. Politeness strategies
- d. Deixis

The correct answer is: Politeness strategies

Question **20**

Not answered

Marked out of 1.00

What is Automatic Speech Recognition (ASR) in the context of natural language processing?

- a. Generating synthetic speech
- b. Transcribing spoken language into written text
- c. Converting written text to spoken words
- d. Analyzing the tonality of speech

The correct answer is: Transcribing spoken language into written text

Unit 5- Part B &C ►

Started on	Tuesday, 22 October 2024, 1:28 PM
State	Finished
Completed on	Tuesday, 22 October 2024, 1:28 PM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

What is the main advantage of Temporal Difference (TD) learning over Monte Carlo methods in terms of efficiency and real-time learning?

- a. TD learning updates value estimates after each time step.
- b. TD learning provides more accurate value function estimates.
- c. TD learning does not require a model of the environment.
- d. TD learning reduces the need for exploration.

Your answer is incorrect.

The correct answer is: TD learning updates value estimates after each time step.

Question **2**

Not answered

Marked out of 1.00

In TD(0) learning, what is the update rule for the value function?

- a. $V(s)=R+\gamma\cdot V(s')$
- b. $V(s)=R+\alpha\cdot(R+\gamma\cdot V(s')-V(s))$
- c. $V(s)=R+\alpha\cdot V(s')$
- d. $V(s)=R+\gamma\cdot V(s')-V(s)$

Your answer is incorrect.

The correct answer is: $V(s)=R+\gamma\cdot V(s')$

Question **3**

Not answered

Marked out of 1.00

How does TD learning differ from Monte Carlo methods in reinforcement learning?

- a. TD learning uses a fixed learning rate.
- b. TD learning only considers the final outcome.
- c. TD learning estimates values at each time step.
- d. TD learning requires a model of the environment.

Your answer is incorrect.

The correct answer is: TD learning estimates values at each time step.

Question **4**

Not answered

Marked out of 1.00

Which of the following is a potential drawback of TD learning in some environments?

- a. TD learning is only effective in fully observable environments.
- b. TD learning doesn't utilize any exploration strategies.
- c. TD learning is computationally expensive and slow.
- d. TD learning can lead to biased value function estimates.

Your answer is incorrect.

The correct answer is: TD learning can lead to biased value function estimates.

Question **5**

Not answered

Marked out of 1.00

What does SARSA stand for?

- a. State-Action-Reward-State-Action
- b. State-Action-Reward-Sarsa
- c. Sequential Actor-Reward State Actor
- d. Stochastic Action Reward SARSA

Your answer is incorrect.

The correct answer is: State-Action-Reward-State-Action

Question **6**

Not answered

Marked out of 1.00

What is the primary goal of SARSA in reinforcement learning?

- a. To maximize the immediate reward in each state.
- b. To learn an optimal policy that maximizes the cumulative discounted future rewards.
- c. To prioritize exploration over exploitation.
- d. To minimize the number of actions taken by the agent.

Your answer is incorrect.

The correct answer is: To learn an optimal policy that maximizes the cumulative discounted future rewards.

Question **7**

Not answered

Marked out of 1.00

How does SARSA adapt to dynamic environments where the optimal policy changes over time?

- a. SARSA is not well-suited for dynamic environments.
- b. SARSA automatically adjusts to changes in the environment without additional modifications.
- c. SARSA requires periodic retraining from scratch.
- d. SARSA relies on external signals to trigger policy updates.

Your answer is incorrect.

The correct answer is: SARSA is not well-suited for dynamic environments.

Question **8**

Not answered

Marked out of 1.00

What does SARSA stand for in reinforcement learning?

- a. State-Aggregate-Reward-Strategy
- b. State-Action-Reward-State-Action
- c. State-Action-Reinforcement-State-Action
- d. State-Action-Reward-State-Advantage

Your answer is incorrect.

The correct answer is: State-Action-Reward-State-Action

Question **9**

Not answered

Marked out of 1.00

What does the Q-function in Q-learning represent?

- a. The immediate reward received after taking an action.
- b. The probability of taking a specific action in a given state.
- c. The expected cumulative reward for taking a specific action in a given state.
- d. The optimal policy for reaching the goal state from any given state.

Your answer is incorrect.

The correct answer is: The expected cumulative reward for taking a specific action in a given state.

Question **10**

Not answered

Marked out of 1.00

What is the drawback of using a high exploration rate in Q-learning?

- a. Increased risk of overfitting to the training data.
- b. Slower convergence to the optimal policy.
- c. Greater likelihood of getting stuck in local optima.
- d. The possibility of missing important state-action pairs.

Your answer is incorrect.

The correct answer is: Slower convergence to the optimal policy.

Question **11**

Not answered

Marked out of 1.00

Which of the following is NOT a key element of the Q-learning update rule?

- a. Learning rate parameter
- b. Estimated Q-value of the next state reached
- c. Current Q-value of the chosen action
- d. Reward received after taking the action

Your answer is incorrect.

The correct answer is: Learning rate parameter

Question **12**

Not answered

Marked out of 1.00

In Q-learning, what does the Q-value represent for a given state-action pair?

- a. The cumulative discounted future rewards of taking the given action in the current state.
- b. The frequency of selecting the given action in the current state.
- c. The immediate reward obtained by taking the given action in the current state.
- d. The probability of taking the given action in the current state.

Your answer is incorrect.

The correct answer is: The cumulative discounted future rewards of taking the given action in the current state.

Question **13**

Not answered

Marked out of 1.00

How does First Visit Monte Carlo handle episodes where a state is revisited after its first occurrence?

- a. It ignores any subsequent visits to the state in the same episode.
- b. It recalculates the optimal policy for the state.
- c. It updates the Q-values for every visit to the state.
- d. It resets the exploration parameter (epsilon) for the state.

Your answer is incorrect.

The correct answer is: It ignores any subsequent visits to the state in the same episode.

Question **14**

Not answered

Marked out of 1.00

In the context of First Visit Monte Carlo (FVMC) methods for reinforcement learning, what is the primary objective?

- a. To update the exploration parameter (epsilon) for each episode.
- b. To estimate the value function by averaging returns from the first visit to each state.
- c. To calculate the optimal policy for a given state.
- d. To initialize the Q-values for each state-action pair.

Your answer is incorrect.

The correct answer is: To estimate the value function by averaging returns from the first visit to each state.

Question **15**

Not answered

Marked out of 1.00

What does the term "td_target" represent in the SARSA algorithm, and how is it calculated in the provided code?

```
td_target = reward + gamma * Q[next_state][next_action] * (not done)
td_error = td_target - Q[state][action]
```

- a. It computes the value function (V) for each state.
- b. It updates the exploration parameter (epsilon).
- c. It tracks the cumulative rewards for each episode.
- d. It represents the target Q-value for the current state and action.

Your answer is incorrect.

The correct answer is: It represents the target Q-value for the current state and action.

Question **16**

Not answered

Marked out of 1.00

In the sarsa function, how are the Q-values updated for a state-action pair during training?

Q[state, action] += alpha * (reward + gamma * Q[next_state, next_action] - Q[state, action])

- a. By setting the Q-value to the maximum between the immediate reward and the discounted future reward.
- b. By subtracting the discounted future reward from the immediate reward and multiplying by the learning rate.
- c. By updating the Q-value with the product of the learning rate, immediate reward, and discounted future reward.
- d. By replacing the existing Q-value with the sum of the immediate reward and the discounted future reward.

Your answer is incorrect.

The correct answer is: By replacing the existing Q-value with the sum of the immediate reward and the discounted future reward.

Question **17**

Not answered

Marked out of 1.00

In the code snippet, what does the variable 'Q' likely represent?

```
def generate_trajectory(select_action, Q, epsilon, env, max_steps=200):
    done, trajectory = False, []
    while not done:
        state = env.reset()
        for t in count():
            action = select_action(state, Q, epsilon)
            next_state, reward, done, _ = env.step(action)
            experience = (state, action, reward, next_state, done)
            trajectory.append(experience)
```

- a. The precision parameter for rounding
- b. The agent's learning rate
- c. The state-action values in a Q-table
- d. The discount factor for future rewards

Your answer is incorrect.

The correct answer is: The state-action values in a Q-table

Question **18**

Not answered

Marked out of 1.00

In the context of reinforcement learning, what does the term "epsilon-greedy policy" mean?

- a. It updates the Q-values for each state-action pair at every episode.
- b. It represents the decay schedule for the learning rate (alpha).
- c. It chooses a random action with uniform probability, occasionally exploring based on a small epsilon.
- d. It ensures that the Q-value for the next state is considered only if the episode is not done.

Your answer is incorrect.

The correct answer is: It chooses a random action with uniform probability, occasionally exploring based on a small epsilon.

Question **19**

Not answered

Marked out of 1.00

What does the line 'Q[state][action] = Q[state][action] + alphas[e] * td_error' do?

- a. Sets the Q-value to a constant value
- b. Adjusts the exploration factor based on the temporal difference error
- c. Updates the Q-value using the Bellman equation
- d. Modifies the reward for the current state-action pair

Your answer is incorrect.

The correct answer is: Updates the Q-value using the Bellman equation

Question **20**

Not answered

Marked out of 1.00

What is the primary purpose of the function generate_trajectory?

```
def generate_trajectory(select_action, Q, epsilon, env, max_steps=200):
    done, trajectory = False, []
    while not done:
        state = env.reset()
        for t in count():
            action = select_action(state, Q, epsilon)
            next_state, reward, done, _ = env.step(action)
            experience = (state, action, reward, next_state, done)
            trajectory.append(experience)
```

- a. To reset the environment and generate random trajectories
- b. To visualize the agent's trajectory in the environment
- c. To calculate the total reward obtained during a trajectory
- d. To generate a sequence of experiences using a given action selection strategy

Your answer is incorrect.

The correct answer is: To generate a sequence of experiences using a given action selection strategy

Unit-IV Questions ►

Started on	Tuesday, 22 October 2024, 1:29 PM
State	Finished
Completed on	Tuesday, 22 October 2024, 1:29 PM
Time taken	10 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In TD learning, what does the term "bootstrapping" refer to?

- a. Employing advanced exploration strategies
- b. Restarting the learning process when convergence is not reached
- c. Using reinforcement learning with deep neural networks
- d. Using the estimated value of a state to update the value of another state

Your answer is incorrect.

The correct answer is: Using the estimated value of a state to update the value of another state

Question **2**

Not answered

Marked out of 1.00

In TD learning, what is the role of the learning rate (α)?

- a. It controls the exploration-exploitation trade-off
- b. It adjusts the rate at which the value function is updated
- c. It defines the probability of taking a specific action
- d. It determines the discount factor

Your answer is incorrect.

The correct answer is: It adjusts the rate at which the value function is updated

Question **3**

Not answered

Marked out of 1.00

In TD learning, what does the term "temporal difference" refer to?

- a. The time it takes for an agent to make a decision
- b. The time it takes for a neural network to converge during training
- c. The duration of an episode in a reinforcement learning task
- d. The difference between predicted and actual rewards at a given time step

Your answer is incorrect.

The correct answer is: The difference between predicted and actual rewards at a given time step

Question **4**

Not answered

Marked out of 1.00

What is the role of the discount factor (γ) in TD learning?

- a. It controls the trade-off between immediate and future rewards.
- b. It prevents the algorithm from getting stuck in cycles.
- c. It determines the learning rate of the algorithm.
- d. It guarantees the convergence of the value estimates.

Your answer is incorrect.

The correct answer is: It controls the trade-off between immediate and future rewards.

Question **5**

Not answered

Marked out of 1.00

Which of the following is a characteristic of the SARSA algorithm?

- a. It requires a model of the environment dynamics
- b. It is an off-policy algorithm
- c. It only considers immediate rewards
- d. It updates the Q-values based on the maximum Q-value of the next state

Your answer is incorrect.

The correct answer is: It updates the Q-values based on the maximum Q-value of the next state

Question **6**

Not answered

Marked out of 1.00

In SARSA, what is the significance of the discount factor (gamma)?

- a. It determines the exploration-exploitation trade-off.
- b. It controls the impact of future rewards on the current Q-value update.
- c. It defines the probability of taking a random action.
- d. It influences the rate of learning in the algorithm.

Your answer is incorrect.

The correct answer is: It controls the impact of future rewards on the current Q-value update.

Question **7**

Not answered

Marked out of 1.00

In the SARSA algorithm, what does the term "on-policy" refer to?

- a. It specifies the number of episodes during training
- b. It signifies the discount factor used
- c. It refers to the policy that is being learned
- d. It indicates the exploration strategy

Your answer is incorrect.

The correct answer is: It refers to the policy that is being learned

Question **8**

Not answered

Marked out of 1.00

How does SARSA adapt to dynamic environments where the optimal policy changes over time?

- a. SARSA is not well-suited for dynamic environments.
- b. SARSA automatically adjusts to changes in the environment without additional modifications.
- c. SARSA relies on external signals to trigger policy updates.
- d. SARSA requires periodic retraining from scratch.

Your answer is incorrect.

The correct answer is: SARSA is not well-suited for dynamic environments.

Question **9**

Not answered

Marked out of 1.00

In Q-learning, what does it mean to be "off-policy"?

- a. It refers to learning from the same policy used to select actions.
- b. It implies that learning is based on a different policy from the one followed.
- c. It indicates that Q-values are updated without considering future rewards.
- d. It means using a fixed, deterministic policy for exploration.

Your answer is incorrect.

The correct answer is: It implies that learning is based on a different policy from the one followed.

Question **10**

Not answered

Marked out of 1.00

In Q-learning, what is the primary objective of the agent during the learning process?

- a. Maximizing the immediate reward in each time step
- b. Balancing the exploration-exploitation trade-off
- c. Maximizing the long-term expected return
- d. Minimizing the temporal difference error

Your answer is incorrect.

The correct answer is: Maximizing the long-term expected return

Question **11**

Not answered

Marked out of 1.00

What does the Q-function in Q-learning represent?

- a. The expected cumulative reward for taking a specific action in a given state.
- b. The probability of taking a specific action in a given state.
- c. The immediate reward received after taking an action.
- d. The optimal policy for reaching the goal state from any given state.

Your answer is incorrect.

The correct answer is: The expected cumulative reward for taking a specific action in a given state.

Question **12**

Not answered

Marked out of 1.00

In Q-learning, what does the Q-value represent for a given state-action pair?

- a. The probability of taking the given action in the current state.
- b. The immediate reward obtained by taking the given action in the current state.
- c. The frequency of selecting the given action in the current state.
- d. The cumulative discounted future rewards of taking the given action in the current state.

Your answer is incorrect.

The correct answer is: The cumulative discounted future rewards of taking the given action in the current state.

Question **13**

Not answered

Marked out of 1.00

What is the significance of the 'min_epsilon' parameter in the sarsa function?

```
def sarsa(env,
          gamma=1.0,
          init_alpha=0.5,
          min_alpha=0.01,
          alpha_decay_ratio=0.5,
          init_epsilon=1.0,
          min_epsilon=0.1,
          epsilon_decay_ratio=0.9,
          n_episodes=3000):
```

- a. It specifies the discount factor for future rewards.
- b. It determines the minimum value for the exploration parameter during decay.
- c. It defines the minimum value for the learning rate (alpha).
- d. It sets the initial value for the exploration parameter (epsilon).

Your answer is incorrect.

The correct answer is: It determines the minimum value for the exploration parameter during decay.

Question **14**

Not answered

Marked out of 1.00

In the context of the SARSA algorithm, what does the term "td_error" signify, and how is it utilized in the code snippet below?

```
td_target = reward + gamma * Q[next_state][next_action] * (not done)
td_error = td_target - Q[state][action]
```

- a. It represents the total discounted reward for the current state-action pair.
- b. It computes the optimal policy for each state.
- c. It tracks the decay of the exploration parameter (epsilon).
- d. It measures the difference between the predicted Q-value and the target Q-value.

Your answer is incorrect.

The correct answer is: It measures the difference between the predicted Q-value and the target Q-value.

Question **15**

Not answered

Marked out of 1.00

What is the purpose of the decay_schedule function in the sarsa code?

```
alphas = decay_schedule(init_alpha,
                        min_alpha,
                        alpha_decay_ratio,
                        n_episodes)
epsilons = decay_schedule(init_epsilon,
                          min_epsilon,
                          epsilon_decay_ratio,
                          n_episodes)
```

- a. To define the exploration-exploitation strategy.
- b. To initialize the Q-values for training.
- c. To schedule the decay of the learning rate.
- d. To handle the decay of the discount factor.

Your answer is incorrect.

The correct answer is: To schedule the decay of the learning rate.

Question **16**

Not answered

Marked out of 1.00

What is the role of the 'pi' lambda function in the provided code?

```
pi = lambda s: {s:a for s, a in enumerate(np.argmax(Q, axis=1))}[s]
```

- a. It computes the optimal policy for a given state.
- b. It tracks the selected actions in each episode.
- c. It updates the exploration parameter (epsilon).
- d. It defines the decay schedule for the learning rate (alpha).

Your answer is incorrect.

The correct answer is: It computes the optimal policy for a given state.

Question **17**

Not answered

Marked out of 1.00

How is the variable `td_error` calculated in the code?

- a. td_error = gamma * Q[next_state].max() * (not done) - reward
- b. td_error = reward + gamma * Q[next_state].max() * (not done) - Q[state][action]
- c. td_error = reward - Q[state][action]
- d. td_error = gamma * Q[next_state].max() - Q[state][action]

Your answer is incorrect.

The correct answer is: td_error = reward + gamma * Q[next_state].max() * (not done) - Q[state][action]

Question **18**

Not answered

Marked out of 1.00

How is the 'experience' variable structured in the function 'generate_trajectory'?

```
for t in count():
    action = select_action(state, Q, epsilon)
    next_state, reward, done, _ = env.step(action)
    experience = (state, action, reward, next_state, done)
    trajectory.append(experience)
```

- a. It is a NumPy array with columns for state, action, reward, next_state, and done
- b. It is a tuple containing state, action, reward, next_state, and done in order
- c. It is a dictionary with keys for state, action, reward, next_state, and done
- d. It is a list containing state, action, reward, next_state, and done in order

Your answer is incorrect.

The correct answer is: It is a tuple containing state, action, reward, next_state, and done in order

Question **19**

Not answered

Marked out of 1.00

In the 'function get_policy_metrics', what does the variable 'goal_state' represent?

- a. The initial state of the environment
- b. The discount factor for future rewards
- c. The number of episodes to run
- d. The target state that the agent aims to reach

Your answer is incorrect.

The correct answer is: The target state that the agent aims to reach

Question **20**

Not answered

Marked out of 1.00

What role does the 'gamma' parameter play in the Q-learning algorithm, and how does it affect the agent's behavior?

- a. 'gamma' controls the verbosity of the tqdm progress bar.
- b. 'gamma' determines the precision level for the state value function.
- c. It is used to update the learning rate during the exploration phase.
- d. It specifies the discount factor for future rewards, influencing the agent's consideration of long-term consequences.

Your answer is incorrect.

The correct answer is: It specifies the discount factor for future rewards, influencing the agent's consideration of long-term consequences.

Unit-IV Questions ►

Started on	Saturday, 23 November 2024, 8:39 AM
State	Finished
Completed on	Saturday, 23 November 2024, 8:39 AM
Time taken	11 secs
Marks	0.00/20.00
Grade	**0.00** out of 10.00 (**0**%)

Question **1**

Not answered

Marked out of 1.00

In Temporal Difference (TD) learning, what does the term "temporal difference" refer to?

- a. The difference between the discounted future reward and the immediate reward.
- b. The difference between the estimated value of two consecutive states.
- c. The difference between the reward received at two consecutive time steps.
- d. The difference between the predicted and actual reward received at the same time.

Your answer is incorrect.

The correct answer is: The difference between the reward received at two consecutive time steps.

Question **2**

Not answered

Marked out of 1.00

In TD learning, what is the role of the learning rate (α)?

- a. It adjusts the rate at which the value function is updated
- b. It controls the exploration-exploitation trade-off
- c. It defines the probability of taking a specific action
- d. It determines the discount factor

Your answer is incorrect.

The correct answer is: It adjusts the rate at which the value function is updated

Question **3**

Not answered

Marked out of 1.00

In TD(0) learning, what is the update rule for the value function?

- a. $V(s)=R+\gamma\cdot V(s')-V(s)$
- b. $V(s)=R+\gamma\cdot V(s')$
- c. $V(s)=R+\alpha\cdot(R+\gamma\cdot V(s')-V(s))$
- d. $V(s)=R+\alpha\cdot V(s')$

Your answer is incorrect.

The correct answer is: $V(s)=R+\gamma\cdot V(s')$

Question **4**

Not answered

Marked out of 1.00

What is the main advantage of Temporal Difference (TD) learning over Monte Carlo methods in terms of efficiency and real-time learning?

- a. TD learning provides more accurate value function estimates.
- b. TD learning updates value estimates after each time step.
- c. TD learning reduces the need for exploration.
- d. TD learning does not require a model of the environment.

Your answer is incorrect.

The correct answer is: TD learning updates value estimates after each time step.

Question **5**

Not answered

Marked out of 1.00

When is SARSA particularly useful in reinforcement learning tasks?

- a. In environments with a deterministic dynamics model
- b. In scenarios with continuous state and action spaces
- c. In tasks where on-policy learning is essential
- d. In episodic tasks with a fixed number of time steps

Your answer is incorrect.

The correct answer is: In tasks where on-policy learning is essential

Question **6**

Not answered

Marked out of 1.00

What does SARSA stand for in reinforcement learning?

- a. State-Aggregate-Reward-Strategy
- b. State-Action-Reward-State-Action
- c. State-Action-Reinforcement-State-Action
- d. State-Action-Reward-State-Advantage

Your answer is incorrect.

The correct answer is: State-Action-Reward-State-Action

Question **7**

Not answered

Marked out of 1.00

What is the purpose of the epsilon-greedy strategy in SARSA?

- a. To always choose the action with the highest Q-value.
- b. To punish the agent for choosing suboptimal actions.
- c. To reduce the impact of rewards in the learning process.
- d. To encourage exploration by choosing a random action with probability epsilon.

Your answer is incorrect.

The correct answer is: To encourage exploration by choosing a random action with probability epsilon.

Question **8**

Not answered

Marked out of 1.00

In SARSA, what is the significance of the discount factor (gamma)?

- a. It defines the probability of taking a random action.
- b. It influences the rate of learning in the algorithm.
- c. It determines the exploration-exploitation trade-off.
- d. It controls the impact of future rewards on the current Q-value update.

Your answer is incorrect.

The correct answer is: It controls the impact of future rewards on the current Q-value update.

Question **9**

Not answered

Marked out of 1.00

In Q-learning, what does it mean to be "off-policy"?

- a. It indicates that Q-values are updated without considering future rewards.
- b. It implies that learning is based on a different policy from the one followed.
- c. It refers to learning from the same policy used to select actions.
- d. It means using a fixed, deterministic policy for exploration.

Your answer is incorrect.

The correct answer is: It implies that learning is based on a different policy from the one followed.

Question **10**

Not answered

Marked out of 1.00

Which of the following is NOT a key element of the Q-learning update rule?

- a. Estimated Q-value of the next state reached
- b. Learning rate parameter
- c. Reward received after taking the action
- d. Current Q-value of the chosen action

Your answer is incorrect.

The correct answer is: Learning rate parameter

Question **11**

Not answered

Marked out of 1.00

What is the fundamental goal of Q-learning in reinforcement learning?

- a. Balancing state-action pairs for equal exploration.
- b. Prioritizing immediate rewards over long-term gains.
- c. Minimizing the exploration-exploitation trade-off.
- d. Learning an optimal policy to maximize cumulative rewards.

Your answer is incorrect.

The correct answer is: Learning an optimal policy to maximize cumulative rewards.

Question **12**

Not answered

Marked out of 1.00

What is the drawback of using a high exploration rate in Q-learning?

- a. Slower convergence to the optimal policy.
- b. The possibility of missing important state-action pairs.
- c. Increased risk of overfitting to the training data.
- d. Greater likelihood of getting stuck in local optima.

Your answer is incorrect.

The correct answer is: Slower convergence to the optimal policy.

Question **13**

Not answered

Marked out of 1.00

In terms of temporal difference learning, what characterizes the update mechanism in FVMC versus SARSA?

- a. FVMC and SARSA do not involve temporal difference learning.
- b. FVMC uses temporal difference errors for Q-value updates, while SARSA relies on averaging returns.
- c. FVMC and SARSA both use temporal difference errors exclusively for Q-value updates.
- d. FVMC estimates returns based on the first visit, while SARSA uses temporal difference errors for Q-value updates.

Your answer is incorrect.

The correct answer is: FVMC estimates returns based on the first visit, while SARSA uses temporal difference errors for Q-value updates.

Question **14**

Not answered

Marked out of 1.00

In the code snippet return Q, V, pi, Q_track, pi_track, what do the variables Q, V, and pi collectively represent?

- a. They represent the Q-values, value function, and optimal policy for each state.
- b. They track the cumulative rewards for each episode.
- c. They store the exploration parameters (epsilon) during training.
- d. They define the learning rates (alpha) for each episode.

Your answer is incorrect.

The correct answer is: They represent the Q-values, value function, and optimal policy for each state.

Question **15**

Not answered

Marked out of 1.00

What does the variable 'Q_track' store in the 'sarsa' function?

- a. The optimal policy for each state at every episode.
- b. The Q-values for each state-action pair at every episode.
- c. The learning rates (alpha) for each episode.
- d. The cumulative rewards for each episode.

Your answer is incorrect.

The correct answer is: The Q-values for each state-action pair at every episode.

Question **16**

Not answered

Marked out of 1.00

How does the 'epsilon_decay_ratio' parameter affect the exploration-exploitation trade-off in the 'SARSA' algorithm?

- a. It determines the initial value of the learning rate (alpha).
- b. It controls the rate at which the exploration parameter (epsilon) decreases over episodes.
- c. It specifies the discount factor for future rewards.
- d. It sets the minimum value for the exploration parameter.

Your answer is incorrect.

The correct answer is: It controls the rate at which the exploration parameter (epsilon) decreases over episodes.

Question **17**

Not answered

Marked out of 1.00

How does the q_learning function use the parameters init_alpha, min_alpha, and alpha_decay_ratio collectively?

- a. They specify the discount factor for future rewards
- b. They set the initial values for the learning rate.
- c. They determine the precision level for the state value function.
- d. They control the verbosity of the tqdm progress bar.

Your answer is incorrect.

The correct answer is: They set the initial values for the learning rate.

Question **18**

Not answered

Marked out of 1.00

In Q-learning, what is the significance of the learning rate (α)?

- a. Adjusts the rate at which Q-values are updated
- b. Influences the discount factor
- c. Sets the reward scaling
- d. Determines the exploration factor

Your answer is incorrect.

The correct answer is: Adjusts the rate at which Q-values are updated

Question **19**

Not answered

Marked out of 1.00

In Q-learning, what happens if the discount factor (γ) is set too close to 0?

- a. Prioritizes short-term rewards
- b. Has no impact on the learning process
- c. Prioritizes long-term rewards
- d. Reduces the exploration factor

Your answer is incorrect.

The correct answer is: Prioritizes short-term rewards

Question **20**

Not answered

Marked out of 1.00

Explain the significance of the term td_error in the context of Q-learning, and how does it influence the update of Q-values?

- a. 'td_error' represents the reward obtained in the current state and directly updates the Q-values.
- b. The 'td_error' term ensures that the Q-value for the next state is considered only if the episode is not done.
- c. It controls the learning rate (alpha) during the exploration phase.
- d. It calculates the temporal difference error, indicating the discrepancy between the predicted and actual rewards.

Your answer is incorrect.

The correct answer is: It calculates the temporal difference error, indicating the discrepancy between the predicted and actual rewards.
